Hazardous Waste Summary:

Waste Code: D001
Waste Description: IGNITABLE WASTE

Waste Code: D006
Waste Description: CADMIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D008
Waste Description: LEAD

Waste Code: D018
Waste Description: BENZENE

Waste Code: D039
Waste Description: TETRACHLOROETHYLENE

Waste Code: D040
Waste Description: TRICHTHORETHYLENE

Waste Code: F002
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHTHORETHYLENE, 1,1,1-TRICHTHORETHANE, CHLOROBENZENE, 1,1,2-TRICHTHORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHTHOROBENZENE, TRICHTHOROFLUOROMETHANE, AND 1,1,2, TRICHTHOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/13/2021	Source: Environmental Protection Agency

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent NPL

SHWS: Promulgated Sites

"Inactive hazardous substance sites that constitute an imminent, substantial danger" is an inactive hazardous substance site where there is a threat of danger to the public health, safety, or environment which is both real and presently existing. Such situations may include, but are not limited to one or more of the following: an immediate action is necessary to minimize an ongoing threat to the public health or pollution of the environment, an inactive hazardous substance site where there is an active release, where direct access to the hazardous substance is not controlled, or where incompatible hazardous substances are found in close proximity. Also known as Promulgated Sites List.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

SPILS: Statewide Petroleum Incident Logging Section

SPILS is a program within TDEC's Division of Solid Waste Management (DSWM). This program logs incidents along Tennessee's roadways where a reportable quantity of petroleum products is released to the environment, ensuring that appropriate cleanup standards are applied, remediation activities are completed, and final reports detailing the response are received and reviewed. Once an incident has been remediated, SPILS will issue a closure letter for the Responsible Party's file.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006	Source: Environmental Protection Agency

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Longitude (West):	89.930312 - 89° 55' 49.12"
Universal Tranverse Mercator:	Zone 16
UTM X (Meters):	233509.3
UTM Y (Meters):	3909061.2
Elevation:	258 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	13048884 MILLINGTON, TN
Version Date:	2019

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ESE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Flood Plain Panel at Target Property</u>	<u>FEMA Source Type</u>
47157C0170F	FEMA FIRM Flood data
<u>Additional Panels in search area:</u>	<u>FEMA Source Type</u>
47157C0165F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u>	<u>NWI Electronic Data Coverage</u>
MILLINGTON	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: MEMPHIS

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	7 inches	silt loam	Not reported	Not reported	Max: 14 Min: 4	Max: 6 Min: 4.5
2	7 inches	18 inches	silty clay loam	Not reported	Not reported	Max: 14 Min: 4	Max: 6 Min: 4.5
3	18 inches	98 inches	silt loam	Not reported	Not reported	Max: 14 Min: 4	Max: 6 Min: 4.5

Soil Map ID: 2

Soil Component Name: FALAYA

Soil Surface Texture: silt loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Somewhat poorly drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 46 inches

Soil Layer Information

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

Source: FEMA

Telephone: 877-336-2627

Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Source: Department of Environment & Conservation

Telephone: 651-532-0052

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

INTERVIEW AND SOURCE DOCUMENTATION

USER QUESTIONNAIRE

1. Project Name: Phase I ESA
2. Location / Address: [See parcel map provided to AKRF](#)
3. Client Contact: [Lori Morris](#) Tel. No: (901) 922-8754
E-mail: lmorris@flymemphis.com
4. Distribution of Reports:
Do you require a physical copy? Y N (The proposal includes delivery of one hard copy)
If Yes, please list delivery address:

Email(s) for electronic delivery: lmorris@flymemphis.com

5. Specific Site Information (to be completed by user):
 - Purpose of performing the ESA (i.e. to qualify for an LLP to CERCLA liability):
[Land Acquisition and natural resource delineation for NEPA documentation](#)
 - What is the Property type and type of transaction (sale, purchase, refinance etc.)?
[Property is undeveloped, mostly wooded with some farmland... MSCAA plans to purchase the parcels to clear the trees that are obstructing the glide slope](#)
 - Are there any scope conditions beyond the requirements of Practice E1527 that are to be considered (asbestos, radon, lead-based paint, lead-in-drinking-water, wetlands, regulatory compliance, endangered species, indoor air quality, mold)
[wetland and stream delineation and environmental risks from farmland](#)
 - Is there another party that needs to rely on the Phase I report?
[the 6 parcels have 3 owners... potentially the property owners could be contacted??](#)
 - Site contacts including names, addresses, phone numbers of persons who have specialized knowledgeable about the site including past and current uses, recognized environmental conditions, hazardous waste activities or regulatory actions.

Name	Phone Number	Relationship to Property
See attached Right of Entry forms		

- Are there any prior Environmental Reports such as ESAs, Phase II investigations, hydrogeologic data for site, geotechnical studies, etc?
 Will Be Provided by Client None Available
- Is there any Site Specific Environmental Documentation such as audit reports, tank registrations, regulatory correspondence, permits, hazardous waste documentation, etc?
 Will Be Provided by Client None Available

6. User Responsibilities

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"), the User must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "*all appropriate inquiries*" is not complete.

To meet the requirements of 40 CFR 312.20 and 312.25, a search for the existence of environmental liens and Activity and Use Limitations (AULs) that are filed or recorded against the Property must be conducted. Unless added by a change in the scope of work to be performed below, ASTM Standard 1527-13 does not impose on the environmental professional the responsibility to undertake a review of recorded land title records and judicial records for environmental liens and AULs.

(1.) Environmental liens that are filed or recorded against the Property (40 CFR 312.25). - Did a search of *recorded land title records* (or judicial records where appropriate) identify any environmental liens filed or recorded against the Property under federal, tribal, state or local law? (Note - In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.)

Yes No Unknown

(2.) Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)). - Did a search of *recorded land title records* (or judicial records where appropriate, see Note above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the Property and/or have been filed or recorded against the Property under federal, tribal, state or local law?

Yes No

a) If yes are you willing to provide a copy of this documentation to Tioga for review?

Yes No

b) Are you planning to conduct the review described above and provide to Tioga for review?

Yes No

c) If not, would you like to authorize Tioga to complete the review described above at an additional fee?

Yes No

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the Property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the Property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

Current property is undeveloped. The Charles Baker Airport was originally built during World War II as an outlying landing field (OLF) to Naval Air Station Memphis and consisted of eight 1600 foot paved runways arranged in a Star of David pattern. Considered surplus at the end of the war, the OLF was released to civilian control in 1946. Charles W. Baker Airport opened in 1959. The airport went through significant growth period in the early 2000's when several hangars were constructed as they are today.

(4.) Relationship of the purchase price to the fair market value of the Property if it were not contaminated (40 CFR 312.29). - Does the purchase price being paid for this Property reasonably reflect the fair market value of the Property?

Yes No

If you conclude that there is a difference, is the lower purchase price because contamination is known or believed to be present at the Property?

Yes No

If your answer is No, please explain the difference:

(5.) Commonly known or reasonably ascertainable information about the property (40 CFR 312.30). - Are you aware of commonly known or reasonably ascertainable information about the Property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,

a) Do you know the past uses of the Property?

Yes No

If yes, describe:

b) Do you know of specific chemicals that are present or once were present at the Property?

Yes No

If yes, describe:

c) Do you know of spills or other chemical releases that have taken place at the Property?

Yes No

If yes, describe:

d) Do you know of any environmental cleanups that have taken place at the Property?

Yes No

If yes, describe:

(6.) The degree of obviousness of the presence or likely presence of contamination at the Property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31). - Based on your knowledge and experience related to the Property are there any obvious indicators that point to the presence or likely presence of releases at the Property?

Yes No

If yes, describe:

RIGHT OF ENTRY ACKNOWLEDGMENT
Charles W. Baker Airport Land Acquisition Project

Project #: 21KMEM06(1)-2M8

Parcels #: 1

RE: Right of Entry to perform the following tasks:
Land Survey
Environmental Assessment Phase I; (and Phase II if necessary)
Appraisal
Review Appraisal

The undersigned acknowledges and authorizes Memphis Shelby County Airport Authority, Charles W. Baker Airport, along with their agent and employees (hereinafter collectively referred to as the "Airport"), to enter upon my real property, described as Tax Parcel #: D0136 00055 (hereinafter referred to as "the Property"), to inspect the Property and perform and/or obtain surveys, studies and assessments, including but not limited to, land boundary survey, appraisal and review appraisal, environmental assessment site visit and pictures taken for surveys, studies and assessments as determined necessary by the Airport. The undersigned agrees to reasonably cooperate with the Airport, regarding the Airport's inspection of the Property, including, but not limited to, executing any documents related to the project.

This right of entry shall lapse after twelve months from the date of execution of this Acknowledgment.

This 30 day of August, 2021.

Margaret D. Renshaw and Eva D. Hussey
177 N. Highland Apt. 4111
Memphis, TN 38111-4777

RE: Charles W. Baker Airport Land Acquisition
Parcel Tax Code: D0136 00056
Parcel No.: 5
Parcel Address: 5861 Raleigh-Millington Road

Dear Ms. Renshaw and Ms. Hussey,

THC, Inc. has been engaged by the Memphis Shelby County Airport Authority on behalf of the Charles W. Baker Airport to assist in the Charles W. Baker Land Acquisition for the Airport Runway Development Project. The land acquisition project will grant the Charles W. Baker Airport the right to acquire such properties for the future development of the Charles W. Baker Airport.

Memphis Shelby County Airport Authority has retained our firm, THC, Inc., to administer the land acquisition portion of this project. Before we can proceed with acquiring the designated property, there are several preliminary steps that must be completed. The initial steps include:

- A property survey to identify the property area to be acquired. (ESP Associates, Inc.),
- Environmental Phase I Assessment (Memphis International Environmental Services),
- An appraisal to determine the value of the identified property (JLL Valuation Advisory), and
- A review of the appraisal report to ensure compliance with applicable regulations and requirements (Christina Thoreson).

Per my conversation on Monday, August 2, 2021, with Ms. Hussey, you mentioned you would like to involve your son and Ms. Renshaw's son in these discussions. Upon receipt of this letter and at the earliest convenience please contact me so we can discuss the project and the steps necessary. The portion of the above mentioned property required for this project is approximately 35 acres of the 210.6320 acreage tract.

Enclosed is a Right of Entry form which will need to be signed by you. This form provides, to the above-mentioned companies, access to the property to perform the listed and necessary tasks to be in compliance with the Federal Regulations 49 CFR part 24 – Uniform Relocation Assistance and Real Property Acquisition for Federal and Federally-Assisted Programs, as amended. Please sign the Right of Entry form and scan/email it back to kdennis@thcinc.net, or FAX it to 770-495-2384 Attn: Keri Dennis or mail it back in the self-addressed stamped envelope enclosed. We respectfully request the Right of Entry form be returned within 3 days of receipt of this letter.

You can reach me at 770-596-5709 and or by email: lgreen@thcinc.net.

We look forward to speaking with you and providing our services throughout this project.

Sincerely yours,

Project Manager, THC, Inc.

Re: Results of Compliance Inspection – No Violations Cited
Charles Baker Airport
3870 Fite Road, Millington
Facility ID #9-790382, Shelby County

Dear Mrs. Morris:

On June 15, 2021 an inspection was performed at the referenced facility. The Division of Underground Storage Tanks (Division) appreciates your cooperation with the inspection process that we must complete together to ensure compliance with the Tennessee Petroleum Underground Storage Tank Act (UST Act) and implementing rules. These inspections are also required at least once every three years to comply with the requirements of the U.S. Environmental Protection Agency (EPA) for Tennessee's EPA-authorized petroleum underground storage tank program (Section 1523 of the Federal Energy Policy Act of 2005). No violations of the Tennessee Petroleum Underground Storage Tank regulations related to the items reviewed during the inspection were discovered.

The Division is always committed to working with tank owners in a respectful, positive, and cooperative manner to help maintain compliance and reach our common goal of safely storing petroleum in the State of Tennessee. We thank you for the effort you've made to protect our natural resources because leaking tanks can contaminate Tennessee's drinking water or cause significant safety hazards and the cost to clean up even small leaks can be very high.

If you have any questions about this letter, please do not hesitate to call me at (901) 275-4203.

Tell us how we're doing! Please take 5-10 minutes to complete our customer survey form at <https://www.tn.gov/environment/about-tdec/contact-tdec-customer-service-form.html>

Sincerely,

David Groce

UST PROGRAM

Ms. Mandy Gates
Department of Environment and Conservation
Division of Underground Storage Tanks
4th Floor L & C Tower
401 Church Street
Nashville, TN 37243-1541

Dear Ms. Gates:

When I requested an invoice from you for two 12,000 gallon tanks at Facility ID #9-790382 Tanks #1 and #2, you advised me that these tanks had been stricken from your computer records. After investigating I find that an error was made which I hope may be rectified.

These tanks were put in service originally in the 1960's by Mr. Haegler, who retired from running Charles Baker Airport in July 1987 at the time the Charles Baker Airport was taken over by Memphis-Shelby County Airport Authority. The tanks were replaced between August 1987 and December 1987 by Bright Construction Company under the Engineering management of the firm of Ellers, Oakley, Chester and Rike, Inc. Mr. Robert E. Stelling, P.E., the project engineer, indicated that he contacted your office, who in turn contacted the Jackson office for an inspector who came down and inspected the soils of the removed tanks. The two new tanks were then installed. No notification of closure as made.

On December 18, 1992, a copy of the Method of Leak Detection forms was sent to your office which included the specifics of the two TDEC 9-790382 tanks. I am enclosing a copy of this letter.

Since we have never recorded closure of these two tanks, and you have the specifics from previous letters, we are enclosing a check for \$250 annual licensing fees for these two tanks. Please let us know if this is satisfactory for correcting your computer records such that we may be invoiced annually for these tanks.

Sincerely,

Thomas J. Langston, P.E.
Acting Manager of Environmental
Services

TRIP REPORT

FACILITY/OWNER Charles W. Baker Airport

DATE 8/11/87 CITY Millington COUNTY Shelby

COMMENTS AND DISCUSSION: _____

This morning I met with Bob Stelling, Consultant with Ellers, Oakley,
Chester & Rike Inc., to observe the removal of two 12,000 gallon storage
tanks. Both tanks were approximately 20 years old but appeared to be in
excellent condition with no noticeable holes. The tank pit was clean
and there was no odor coming from the backfill they had removed from the
pit. I informed them they could go ahead and install the new 12,000 gallon
fiberglass tanks at the site.

Pursuant to Tennessee Petroleum U.S.T. Act Section 11 T.C.A. 68-53-10 et seq, owners/operators of Underground Storage Tanks shall pay an annual per tank fee of 100.00 on or before 01-JUL of each calendar year: a late fee of 5% per month on the unpaid balance shall be assessed on the first day of delinquency. Thereafter, on the last day of each month during which any part of any fee or any prior accrued penalty remains unpaid, an additional five percent (5%) of the then unpaid balance, shall accrue and be added thereto.

Larkin Myers, PE
President

Education: Degree(s)/Year/Specialization
B.S./1999/Civil Engineering

Continuing Education / Professional Certification:

Arkansas PE license #11632
Mississippi PE license #16367
Tennessee PE license #109304
LEED AP GBCI #10135789

Experience:

June 1999 – December 2003: White-Daters & Associates, Engineer-in-Training
*December 2003 – February 2010: Pickering Firm, Inc., Civil Engineer/Associate Principal
Owner*
June 2011 – January 2020: Tioga Environmental Consultants, Vice President
January 2020 – Current : Tioga Environmental Consultants, President

Larkin Myers is a professional engineer registered in Arkansas, Mississippi and Tennessee. She is also a certified LEED AP and maintains Level 1 and 2 Erosion Prevention and Sediment Control certifications. She had twelve years of experience as a civil engineer working with land development projects prior to joining Tioga in 2011. Ms. Myers provides oversight for Phase I and II Environmental Site Assessments, NEPA reviews and natural resources projects.

RESUME

Ben S. Day

Senior Environmental Scientist

Education: Degree(s)/Year/Specialization
B.S./1995/Biological Sciences

Experience:

January 2001 – April 2016: Goldie and Associates, Inc., Senior Environmental Scientist / Laboratory Manager

May 2016 – Current: Tioga Environmental Consultants, Senior Environmental Scientist

Ben is a Senior Environmental Scientist for Tioga. He has completed his Masters level coursework in Environmental Toxicology and has a B.S. Degree in Biological Sciences from Clemson University. His technical specialties include air pollution; wetland delineations and permitting; environmental assessments and audits; groundwater, soil, soil gas analysis and remediation design; and NPDES wastewater / stormwater permitting and reporting. In addition, Ben has extensive experience managing and operating an environmental laboratory.

July 2015 – Current: Tioga Environmental Consultants, Environmental Scientist

William Gray is an accredited Environmental Scientist, Associate Professional Soil Scientist, and Qualified Hydrologic Professional that has been with Tioga since July of 2015.

APPENDIX 8
GLOSSARY OF TERMS

Glossary of Terms

The following abbreviated list of definitions is in accordance with ASTM Standard E 1527-13, the practice, and is not intended as an exhaustive list but rather as a reference of commonly used terms found in the Phase I Environmental Site Assessment.

- *adjoining properties* – any real *property* or properties the border of which is contiguous or partially contiguous with that of the *property*, or that would be contiguous or partially contiguous with that of the *property* but for a street, road, or other public thoroughfare separating them. (§3.2.4)
- *business environmental risk* – a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of *commercial real estate*, not necessarily limited to those environmental issues required to be investigated in this practice. Consideration of *business environmental risk* issues may involve addressing one or more non-scope considerations... (§ 3.2.11)
- *controlled recognized environmental condition* – a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). (See Note 2.) A condition considered by the environmental professional to be a controlled recognized environmental condition shall be listed in the findings section of the Phase I Environmental Site Assessment report, and as a recognized environmental condition in the conclusions section of the Phase I Environmental Site Assessment report. (§3.2.18)
- *due diligence* – the process of inquiring into the environmental characteristics of a parcel of *commercial real estate* or other conditions, usually in connection with a *commercial real estate* transaction. The degree and kind of *due diligence* vary for different properties and differing purposes. (§3.2.26)
- *environmental site assessment (ESA)* - the process by which a person or entity seeks to determine if a particular parcel of real property (including improvements) is to *recognized environmental conditions*. At the option of the *user*, an *environmental site assessment* may include more inquiry than that constituting *all appropriate inquiries* or, if the *user* is not concerned about qualifying for the [landowner liability protection], less inquiry than that constituting *all appropriate inquiries*. An *environmental site assessment* is both different from and often less rigorous than an *environmental compliance audit*. (§3.2.30)
- *historical recognized environmental condition* – a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a historical recognized environmental condition, the environmental professional must determine whether the past release is a recognized environmental condition at the time the Phase I Environmental Site Assessment is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past release to be a recognized environmental condition at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a recognized environmental condition. (§3.2.42)

- *key site manager* – the person identified by the *owner* or *operator* of a *property* as having good knowledge of the uses and physical characteristics of the *property*. (§3.2.47)
- *material threat* - a physically observable or *obvious threat* which is reasonably likely to lead to a release that, in the opinion of the *environmental professional*, is threatening and might result in impact to public health or the environment... (§3.2.55)
- *migrate/migration*—for the purposes of this practice, “migrate” and “migration” refers to the movement of *hazardous substances* or *petroleum products* in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface. (§3.2.56) See Note 4.

Note 4 - Vapor migration in the subsurface is described in Guide E2600; however, nothing in this practice should be construed to require application of the Guide E2600 standard to achieve compliance with all appropriate inquiries.

- *practically reviewable* – information that is *practically reviewable* means that the information is provided by the source in a manner and in a form that, upon examination, yields information relevant to the *property* without the need for extraordinary analysis of irrelevant data. The form of the data shall be such that the *user* can review the records for a limited geographic area. Records that cannot be feasibly retrieved by reference to the location of the *property* are not generally *practically reviewable*. Most databases of public records are *practically reviewable* if they can be obtained from the source agency by the county, city, zip code, or other geographic area of the facilities listed in the record system. Records that are sorted, filed, organized, or maintained by the source agency only chronologically are not generally *practically reviewable*. Listings in *publicly available* records which do not have adequate address information to be located geographically are not generally considered *practically reviewable*. For large databases with numerous records (such as RCRA hazardous waste generators and registered *underground storage tanks*), the records are not *practically reviewable* unless they can be obtained from the source agency in the smaller geographic area of zip codes. Even when information is provided by zip code for some larger databases, it is common for an unmanageable amount of sites to be identified within a given zip code. In these cases, it is not necessary to review the impact of all of the sites that are likely to be listed in any given zip code because that information would not be *practically reviewable*. In other words, when so much data is generated that it cannot be feasibly reviewed for its impact on the *property*, it is not *practically reviewable*. (§3.2.69)
- *reasonably ascertainable* – information that is (1) *publicly available*, (2) available from its source within reasonable time and cost constraints, and (3) *practically reviewable*. (§3.2.77)
- *recognized environmental condition* - the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions. (§3.2.78)
- *release*—a release of any hazardous substance or petroleum product shall have the same meaning as the definition of “release” in CERCLA 42 U.S.C. § 9601(22)). For additional background information, see Legal Appendix (Appendix X1) to X1.1.1 “Releases and Threatened Release.” (§3.2.82)
- *records review* – that part that is contained in Section 8 of this practice that addresses which records shall or may be reviewed. (§3.2.81)
- *site reconnaissance* – that part that is contained in Section 9 of this practice and addresses what should be done in connection with the *site visit*. The *site reconnaissance* includes but is not limited to, the *site visit* done in connection with such a *Phase I Environmental Site Assessment*. (§3.2.84)

- *site visit* – the visit to the *property* during which observations are made constituting the *site reconnaissance* section of this practice. (§3.2.85)
- *user* - the party seeking to use Practice E 1527 to complete an *environmental site assessment* of the *property*. A *user* may include, without limitation, a potential purchaser of *property*, a potential tenant of *property*, an owner of *property*, a lender, or a *property* manager. The *user* has specific obligations for completing a successful application of this practice as outlined in Section 6 [of this practice]. (§3.2.98)

MANAGEMENT SUMMARY

At the request of AKRF, Inc., Commonwealth Heritage Group, Inc. (Commonwealth) conducted a Phase I cultural resources survey for the Charles Baker Airport property purchases. The purpose of the survey was to identify any cultural resource that is listed on, eligible for, or potentially significant for the National Register of Historic Places (NRHP) present within the APE, and to provide appropriate management recommendations for any such cultural resource(s) identified.

The Memphis-Shelby County Airport Authority proposes to purchase 97.2 ac. (39.3 ha) along and north of runway 36/18 at the Charles Baker Airport as a part of a tree obstruction removal project. The entire 97.2 ac. (0.1519 mi.²) purchase area is considered the area of potential effect (APE). The terrain within the APE includes nearly level and undulating to rolling uplands, with elevations ranging from less than 250 ft. near the runway to over 290 ft. in the north. The APE is drained by an unnamed tributary of the Loosahatchie River and includes an extensive area of wetlands along this stream.

A standard cultural resources site files search reveals that there are no previously recorded archaeological sites or historic properties located within the APE. Note however, that a portion of the Baker Airport to the south of the APE is recorded as archaeological site 40SY704, a WW II airfield, based on archival research.

The fieldwork for the assessment was conducted over four days between February 2 and 16, 2022. Site detection method relied primarily on the excavation of shovel tests at 20 m intervals and visual inspection. During the course of the fieldwork a total of 498 shovel tests was recorded within the 97.2 ac. APE, including 442 that were negative for cultural material and 56 “no-test” locations where a planned shovel test was not dug, mainly due to standing water. The shovel test depths ranged from 3 cm to 48 cm and averaged 32.17 cm ± 7.05 cm. Larger areas of wetlands, principally located in the central and western portions of the tract, were not shovel tested but they were visually inspected.

The survey of the Baker Airport APE resulted in the identification of two newly recorded archaeological sites (Site 40SY925 and Site 40SY926); there are no standing structures. Both are deflated, low-density surface scatters with no subsurface integrity, and 100 percent surface collections were obtained from each. Site 40SY925 is multi-component, and the use of extra-local raw materials among the two Late Archaic/Early Woodland PP/Ks from here implies that the groups occupying the site at that time were mobile and likely practiced a seasonal round settlement pattern with part of the year residing in west Tennessee near the Mississippi River and part of the year living to the east along the lower Tennessee River. Later site 40SY925 was occupied by a more sedentary Woodland group that used ceramics, and then during the late nineteenth and early twentieth century it was a farmstead. Site 20SY926 is interpreted as a briefly occupied Late Woodland/Mississippian hunting camp or chipping station.

The recommended NRHP status for Sites 40SY935 and 40SY926 is not eligible. Both are low-density scatters and there was no subsurface recovery from either. Both site locations appear to eroded and deflated, thus destroying their integrity. Additional investigations at Sites 40SY935 and 40SY926 are unlikely to yield any additional significant archaeological data. As there is no NRHP listed, eligible, or potentially significant cultural resource within the APE, no further work is recommended.

ACKNOWLEDGEMENTS

Commonwealth Heritage Group, Inc. appreciates the opportunity to have provided AKRF, Inc. and the Memphis-Shelby County Airport Authority with our services. Michael Pappalardo and Jennifer Hogan managed the project for AKRF, Inc.

Commonwealth Heritage Group, Inc. personnel who contributed to the project include the following individuals. Andrew Saatkamp, RPA directed the fieldwork. The field crew included Alex Derrera, Jacob Mabrey and Alysia Shear. Arabella Baer, RPA conducted the artifact analysis. Dania Helou, MA edited the report. Kate Gilow provided administrative support throughout the project.

1. INTRODUCTION

At the request of AKRF, Inc., Commonwealth Heritage Group, Inc. (Commonwealth) conducted a Phase I cultural resources survey for the Charles Baker Airport property purchases. The survey was designed to create an inventory of cultural resources within the area of potential effect (APE) and to make appropriate management recommendations for their treatment.

The project was conducted to assist Charles Baker Airport and the Memphis-Shelby County Airport Authority in complying with various Federal statutes, including Section 106 of the National Historic Preservation Act of 1966, as amended; Executive Order 11593; and the Advisory Council's "Protection of Historic Sites (36 CFR Part 800)," effective 17 June 1999. The investigations were designed to comply with the following professional standards and guidelines:

- a. National Park Service (NPS) National Register Bulletin 15 "How to Apply the National Register Criteria for Evaluation," and Bulletin 36 "Guidelines for Evaluating and Registering Historical Archeological Sites and Districts"
- b. Secretary of Interior's "Standards and Guidelines for Archaeology and Historic Preservation" as published in the *Federal Register*, 29 September 1983
- c. The Advisory Council on Historic Preservation (ACHP) guidelines set forth in 36 CFR 800, "Protection of Historic Properties"
- d. The *Tennessee SHPO Standards and Guidelines for Archaeological Resource Management Studies* (October 2018).
- e. TDOT Scope of Work for Consultant Implemented Archaeological Assessments May 2021.

PROJECT BACKGROUND

Charles W. Baker Airport is owned and operated by the Memphis-Shelby County Airport Authority. This general aviation airport is located just 10 mi. from downtown Memphis, at 3870 Fite Road in Millington, Tennessee, and can be identified on the Millington, TN 7.5-min. quad. (Figure 1-01). Services include fuel, hangar and ramp space, aircraft parking and more.

The Memphis-Shelby County Airport Authority proposes to purchase 97.2 ac. (39.3 ha) along and north of runway 36/18 at the Charles Baker Airport as a part of a tree obstruction removal project (Figure 1-02). The entire 97.2 ac. (0.1519 mi.²) purchase area is considered the area of potential effect (APE). The purchase area is distributed across six parcels from north to south:

- 26 ac. wooded
- 32 ac. most wooded
- 35 ac. half wooded and half agricultural
- 1.5 ac. wooded
- 1.2 ac. wooded
- 1.5 ac. wooded

The terrain within the APE includes nearly level and undulating to rolling uplands, with elevations ranging from less than 250 ft. near the runway to over 290 ft. in the north. The APE is drained by an unnamed tributary of the Loosahatchie River and includes an extensive area of wetlands along this stream (Figure 1-03).

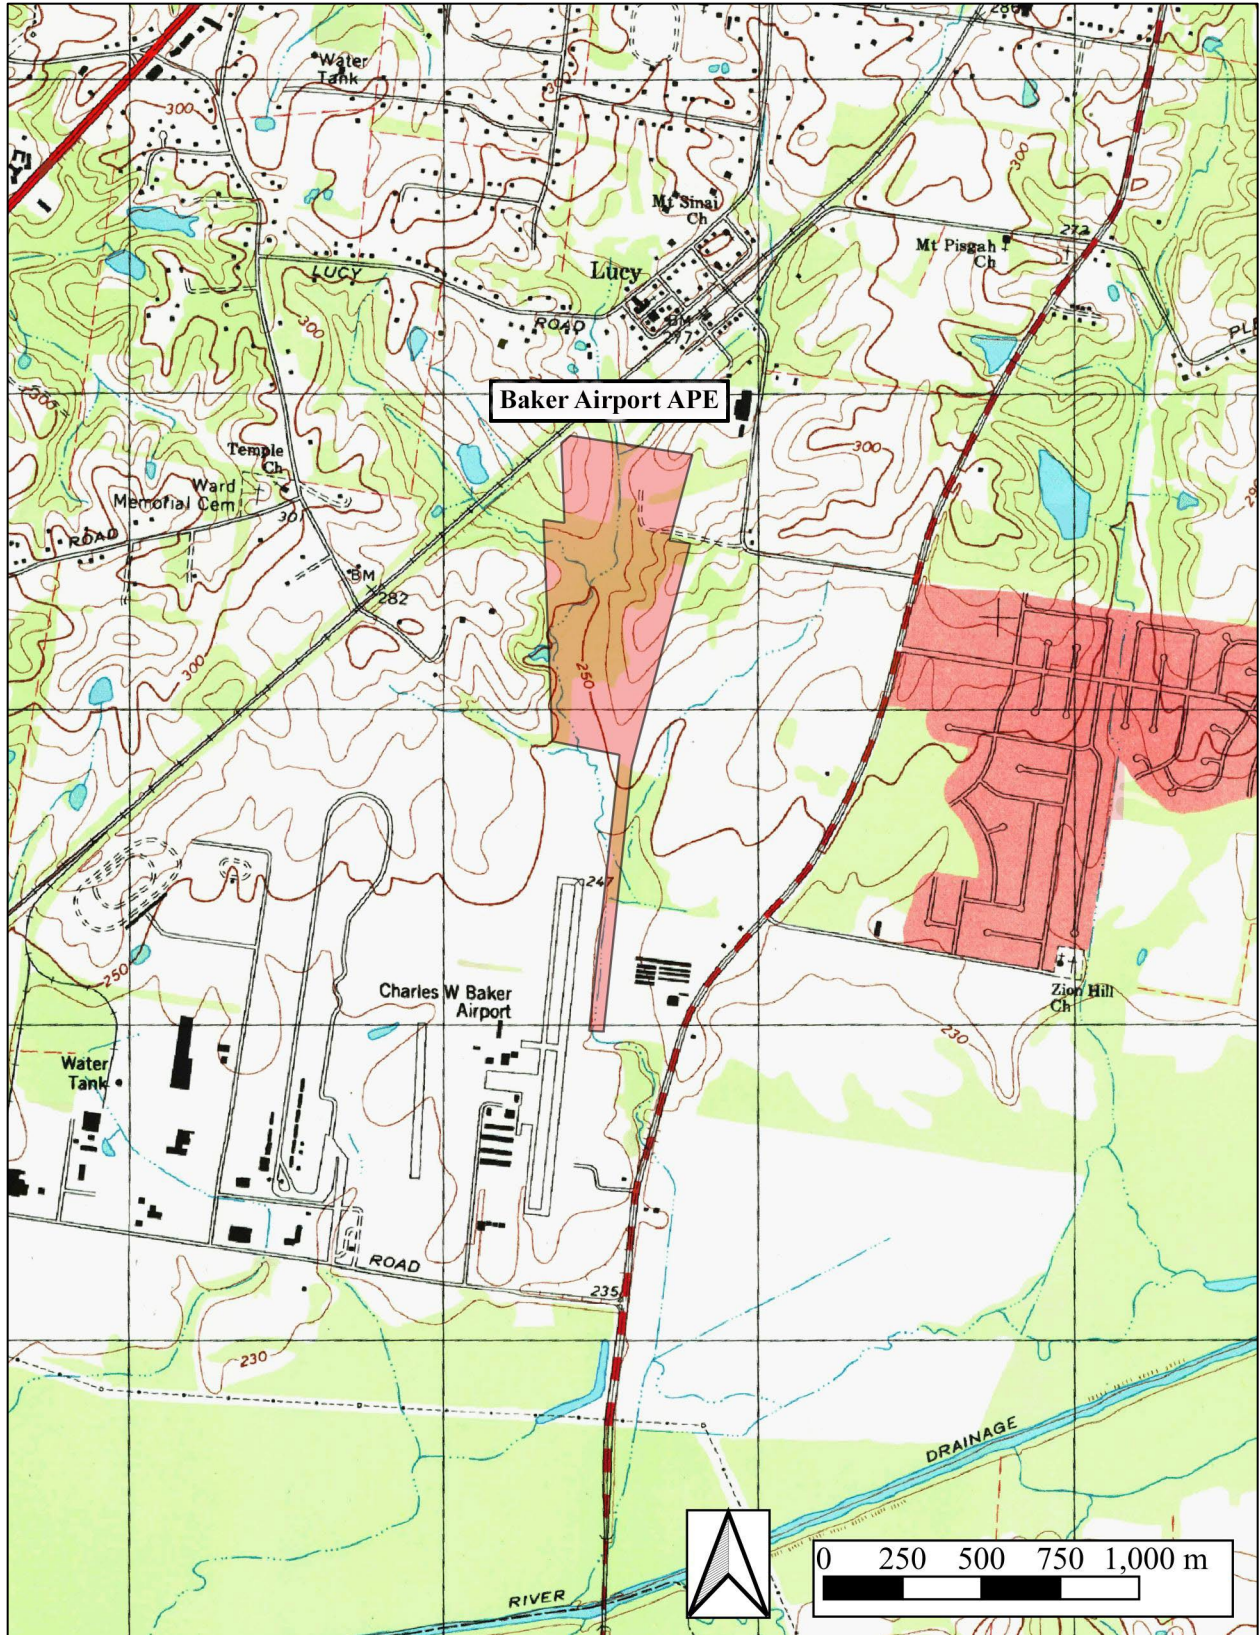

Figure 1-01. Charles W. Baker Airport purchases APE shown on the 1997 Millington, TN 7.5-min. quad.

Key: STR-Intermittant Stream; WTL-Wetland; EPH-Ephemeral Stream.

2. ENVIRONMENTAL SETTING

GEOLOGY

The Charles W. Baker Airport APE is located within the west Tennessee loess sheet. Stearns (1975) refers to the loess sheet as the West Tennessee Plain and views it as a subregion of the Gulf Coastal Plain physiographic province (Fenneman 1938). A more recent ecoregion map refers to this area as the Loess Plains (74b), a Level IV ecoregion with the Mississippi Valley Loess Plains (a Level III ecoregion) (Griffith et al. 2004; Figure 2-01). The Loess Plains cover 4,023 mi.² in Tennessee, and the topography consists of level to gently rolling terrain that is the result of sequential deposition and erosion of Pleistocene (Late Wisconsin) loess. Wide, flat bottomlands and floodplains are present within the Loess Plains, and they harbor low gradient silt, and sand-bottomed streams; most of which have been channelized.

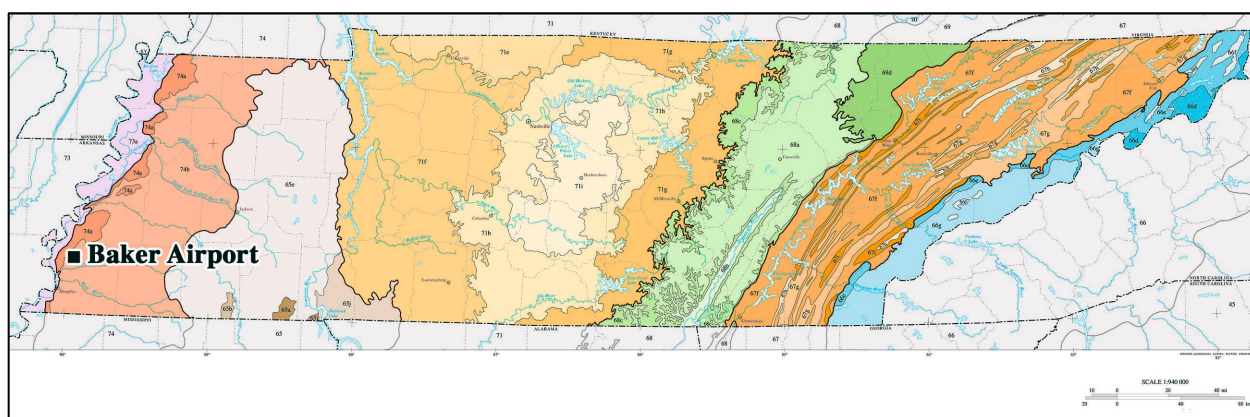

Figure 2-01. Charles W. Baker Airport location shown on an ecoregions map of Tennessee (Griffith et al. 2004).

The loess deposit is thickest (24 m) along the Mississippi River—this is the reason for the various Chickasaw bluffs—and it thins to the east (Stearns 1975). Well logs from the Memphis Defense Depot reveal that the loess ranges 7.0–10.1 m thick in this area (Law Environmental 1990). Geologic studies of the loess sediments along Nonconnah Creek reveal that the loess is stratigraphically equivalent to the Late Wisconsin Peoria loess of the Upper Mississippi Valley (Cowell 1977). Remains of American mastodon and other now-extinct Late Pleistocene megafauna have been discovered deeply buried within Memphis’s loess (Corgan and Breitburg 1996). Brister et al. (1981) date one such find on Nonconnah Creek to 15,000–21,000 B.C.

SOILS

Fourteen phases of seven soil series are represented within the APE (Figure 2-02) (Sease et al. 1989:Sheet 28). The extent of these soils within the APE was calculated using the Web Soil Survey area online application (Table 2-01). Memphis series soils are the most extensive, with five phases covering 40.6 percent of the APE. This series consists of deep, well-drained, strongly acid, silty soils on uplands that form in loess (Sease et al. 1989:29). Like most soils in the loess plains, the Memphis series are prone to erosion.

Figure 2-02. Distribution of soils within the Charles W. Baker Airport APE (map generated using the USDA Web Soil Survey).

Table 2-01. Soils represented within the APE.

Map Unit Symbol	Soil type/phase	Capability Unit	Percent of APE
Ad	Adler silt loam, 0 to 2 percent slopes, occasionally flooded	I-2	13.0%
Ca	Calloway silt loam, 0 to 2 percent slopes	IIIw-2	0.7%

MeB2	Memphis silt loam 2 to 5 percent slopes, moderately eroded, northern phase	IIIe-1	4.7%
MeC2	Memphis silt loam 5 to 8 percent slopes, moderately eroded, northern phase	IIIe-1	22.5%
MeD2	Memphis silt loam 8 to 12 percent slopes, moderately eroded, northern phase	IVe-1	1.4%
MeE	Memphis silt loam 12 to 20 percent slopes, northern phase	VIe-1	0.6%

At 34.2 percent, Fayalya is the next most extensive series and is represented by only one type: Fayalya silt loam. Falaya series are poorly drained silty soils on bottoms, in this case, distributed along the drainage within the APE (Sease et al. 1989:16).

The Adler series, represented by Adler silt loam, 0 to 2 percent slopes, occasionally flooded, is the third best-represented series at 13.0 percent. This series consists of deep, moderately well-drained, neutral, silty soils on narrow bottoms that formed in recent deposits of silt washed from steep loess hills (Sease et al. 1989:10).

Note that six of the soil type-phases listed in Table 2-01 are characterized as eroded or moderately eroded. These soils are unlikely to contain significant and/or intact archaeological deposits because the surface soil horizon has been carried away by erosion.

Because soils are indicators of past environments, soil types can be used to predict a given tract's potential for containing archaeological deposits. The Soil Conservation Service's "Capability Unit" classification is a measure of the limitations of each soil type that can restrict its use. These capability units are used by archeologists as indicators of the potential that a given soil type has for containing an archaeological deposit because soils with few limitations are more likely to yield evidence of human occupation than soils with moderate or severe limitations.

From an archaeological standpoint, capability units are evaluated as follows:

- Class I soils have few limitations that restrict their use and are considered to have a high probability of containing archaeological resources.
- Class II soils have moderate limitations and are considered to have a moderate probability of containing archaeological resources.

- Class III and IV soils have severe limitations and are considered to have a low probability of containing archaeological resources.
- Class V and VI soils have very severe limitations and are considered to have little probability of containing archaeological resources.

Based on soil capability, the 13.0 percent of the APE that is mapped as Adler silt loam, 0 to 2 percent slopes, occasionally flooded is the only high probability area. Three capability unit II soils cover 47.7 percent of the APE, and these areas are considered moderate probability zones. The remaining 39.3 percent of the tract is covered in capability unit III or lower soils and is considered low probability terrain.

DRAINAGE

The principal drainage of Shelby County is the Mississippi River. Major tributaries emptying into the Mississippi River in Shelby County include (from north to south) the Loosahatchie River, Wolf River, and Nonconnah Creek.

The APE is drained by an unnamed tributary of the Loosahatchie River. The Loosahatchie River is 64-mi. long, and its watershed covers approximately 738 mi.² and includes parts of Fayette, Hardeman, Haywood, Shelby, and Tipton counties (Tennessee Department of Environment and Conservation 2014). The Corps of Engineers has extensively modified the lower Loosahatchie River, and the reaches in and near the APE have been channelized. A 1927/1932 map reveals that these sections of the lower Loosahatchie River were already channelized by that time.

FLORA

Shelby County is part of the Mississippi Embayment Section of the Western Mesophytic Forest Region as described by Braun (1964:157) and the Tulip-Oak Forest as described by Shelford (1974:35). Oak and Oak-Hickory floral communities predominate in this region along the stream and river terraces, with swamp forest species predominating along low-lying floodplain areas. However, much of the modern landscape is so modified that the flora is in no way reflective of a natural setting.

Floral species within the former Oak and Oak-Hickory communities include white oak (*Quercus alba*), southern red oak (*Quercus falcata*), hickory (*Carya* sp.), and tuliptree (*Liriodendron tulipifera*) at higher elevations, with beech (*Fagus grandifolia*), sugar maple (*Acer saccharum*), and bald cypress (*Taxodium distichum*) occurring at only very low elevations such as those immediately abutting local drainages. The undergrowth in these communities is characteristically sparse, with dogwood (*Cornus florida*), winged elm (*Ulmus alata*), persimmon (*Diospyros virginiana*), sassafras (*Sassafras albidium*), mulberry (*Morus* sp.), white ash (*Fraxinus americana*), and holly (*Ilex* sp.) accounting for the majority of species (Braun 1964:157). In particular, mast-producing species such as the various oaks and hickories would have represented an important subsistence resource for humans occupying this region.

FAUNA

Faunal species occupying these communities include large mammals such as the white-tailed deer (*Odocoileus virginianus*) and black bear (*Ursus americanus*); smaller mammals such as opossum (*Didelphis marsupialis*), raccoon (*Procyon lotor*), rabbit (*Sylvilagus* sp.), beaver (*Casor canadensis*), otter (*Lutra canadensis*), and squirrel (*Sciurus* sp.); and large terrestrial birds including wild turkey (*Meleagris gallapavo*). Migratory waterfowl such as ducks (*Anas* sp.) and geese (*Branta* sp.) undoubtedly also frequented these communities on a seasonal basis. Riverine species within these communities would have included fish species such as bass (*Micropterus*

sp.), catfish (*Ictalurus* sp.), sunfish (*Lepomis* sp.), drum (*Aplodinotus grunniens*), and gar (*Leisosteus* sp.). All the faunal species described immediately above would have offered important subsistence resources for humans occupying the area during prehistoric and historic times.

PALEOCLIMATE/VEGETATION

Paleoenvironmental conditions were substantially different in the late Pleistocene through the middle Holocene. Delcourt et al. (1999) have recently synthesized current data and mapped vegetation reconstructions for the Central Mississippi Valley. The discussion that follows is drawn from this summary. During the Late Wisconsin full-glacial interval (18,000 B.C.), the central Mississippi River valley was covered by boreal forest communities, and a Spruce-Willow Forest was on the valley train surfaces that were fed by glacial meltwater from the Ohio River. Post-glacial warming caused jack pine population to collapse about 12,000 B.C., but the area east of Crowley's Ridge remained a Spruce-Willow Forest. By 10,000 B.C. warming temperatures led to an expansion of Oak-Hickory Forest on abandoned braided stream terraces, and the Spruce-Willow Forest became more restricted as the active channel of the Ohio River shifted east.

By 8,000 B.C., "the vegetation had become temperate to warm temperate in character" (Delcourt et al. 1999:25). Sweetgum-Elm Forest and Willow-Cane Forest developed along and near the now-meandering Mississippi River, while the Oak-Hickory Forest continued to expand on abandoned braided stream terraces.

At 6,000 B.C., the effects of a warm and dry interval referred to as the Hypsithermal begin to be seen in the pollen record. Drought-tolerant species expanded, and the Oak-Hickory Forest that formerly covered the valley train to the west of the project area developed into an Oak-Hickory Savannah. However, along and near the Mississippi River, Sweetgum-Elm Forest and Willow-Cane Forest remained, and Cypress-Tupelo Forest expanded in the backswamps.

Regionally, the Hypsithermal was most strongly felt around 4,000 B.C., and the arid conditions continued until after 2,000 B.C. (Delcourt et al. 1999). McNutt (1996) suggests that during 5,500–3,500 B.C. the strongest cultural impacts of the Hypsithermal were felt. Willow-Cane Forest and Cypress-Tupelo Forest became "confined to the easternmost portion of the Eastern Lowlands along a relatively narrow meander belt" that would have included the Barnes Ridge area (Delcourt et al. 1999:26). Within the backswamps, mesic lowland forest probably expanded into Cypress-Tupelo Forests because of dropping water tables.

Modern floristic regions developed between 2,000 B.C. to 1,000 B.C. with a return to wetter conditions. The Sweetgum-Elm Forest re-expanded along drainages, and Willow-Cane Forest "occupied a broadening and shifting Mississippi meander belt" (Delcourt et al. 1999:27). Changes in the locations of Willow-Cane, Sweetgum-Elm, and Cypress-Tupelo Forests became dependent on shifts in channel morphology.

In discussing the 1,000 A.D. environment, Delcourt et al. (1999) note that portions of the Eastern Lowlands would have been covered by Ragweed-Grass Old Field vegetation. This refers to "anthropogenically disturbed landscapes" (Delcourt et al. 1999:28), such as Native American (Mississippian period) cornfields with early successional grassland and thickets for cover. Delcourt et al. (1999:28) state, the "paleoecological 'signature' of cultural impact is characterized by occurrence of pollen grains of cereals such as maize; weedy herbs including ragweed, chenopods, and grasses; and spores of old-field ferns, such as bracken."

MODERN CLIMATE

Shelby County's climate is typical of the central Mississippi River valley, with hot summers and mild winters, and abundant rainfall. The average annual temperature in Memphis is 62° F, although extremes of 106° F and -11° F were recorded during the period spanning 1931–1960 (Sease et al. 1989:2). The growing season is long (238 days), extending from March 20 to November 12 (Sease et al. 1989:3). July is the warmest month, with daily average maximum and minimum temperatures of 92.1° F and 71.5°, and January is the coldest month, with daily average maximum and minimum temperatures of 50.6° F and 33.4° (Sease et al. 1989:Table 1).

Rainfall amounts vary throughout the county, with differences of up to two inches per annum recorded between the western and eastern portions (Sease et al. 1989:2). The average precipitation per annum is 49.73 inches (Sease et al. 1989:Table 1). Precipitation is normally heaviest during the winter and early spring months, with January on average having 6.07 in. (Sease et al. 1989:Table 1). Fall is the driest season, and October, with an average of 2.72 in. of precipitation, is the driest month (Sease et al. 1989:Table 1).

3. CULTURAL BACKGROUND

This chapter provides background information relevant to the study area. A briefing on previous archaeological and historic studies conducted in West Tennessee is presented first, followed by a synopsis of fieldwork conducted in close proximity to the study area. Another section provides an overview of the archaeological and historical sequence of West Tennessee, as it is currently understood. These later discussions follow the standard period-by-period format.

PREVIOUS INVESTIGATIONS

ANTIQUARIAN INVESTIGATIONS

Archaeological investigations in this portion of West Tennessee were initially conducted by untrained but interested individuals and were focused on the monumental earthworks of the Pinson Mounds (40MD1) on the South Fork of the Forked Deer River. This large mound and earthwork complex was first described by the antiquarian historian Judge Haywood (1823:136–137) and later by the State Geologist Troost (1845:364–365). Schoolcraft (1854) produced one of the earliest summaries of Native Americans and archaeology at this time.

After the Civil War, antiquarian researchers, primarily working for museums, radiated across the Southeast in a quest for museum specimens. Mainfort's (1986:8–9) research indicates that in 1875, the Smithsonian Institution hired a local college president, E.H. Randle, to explore the mounds of West Tennessee, including Pinson. Dr. Joseph Jones (1984 [1876]) published a description of the Obion site (40HY14) on the North Fork of the Obion River and notes a stone figurine unearthed there in 1845 by a farmer, Mr. Hartsfield. At about this time (1879), the Bureau of American Ethnology (BAE), a branch of the Smithsonian, was founded.

In Cyrus Thomas's classic *Mound Explorations* (1985 [1894]), the Mound Builder myth was destroyed, and the origin of the mounds was demonstrated to be associated with Native Americans. Thomas (1985 [1894]:278–279) mentions mounds from only two West Tennessee counties, Lauderdale and Obion. He notes a number of small mounds, already disturbed by relic collectors, in Lauderdale County at Mr. Marley's farm, eight miles northwest of Ripley. The mounds in the Reelfoot Lake vicinity in Obion County and some of the artifacts the BAE excavators recovered are briefly described.

Other important antiquarian figures in Tennessee archaeology are Professor Putnam (1973 [1878]) and G.P. Thruston (1897). In the latter nineteenth and early twentieth centuries, the predominant archaeological research issue shifted away from the origin of the mounds to the antiquity of the human occupation of America.

EARLY TWENTIETH CENTURY

William E. Myer, a Tennessean and employee of the Smithsonian, was one of the most significant figures in early twentieth-century Tennessee archaeology. While much of Myer's work focused on Middle Tennessee, he is responsible for initiating a survey of Pinson Mounds by a professional engineer and providing a description of the complex. Myer's manuscript, *Stone Age Man in the Middle South*, was never published, but a microfilm transcript of this early synthesis of Tennessee archaeology is available and is commonly cited (Myer 1917). Myer (1971 [1928]) also compiled an *Archaeological Map of the State of Tennessee*.

C.W. Bishop of Harvard University's Peabody Museum did an archaeological reconnaissance in Henry County in 1911 and 1912. In the summer of 1913, Bishop and Bruce Merwin directed the major excavations of the mounds at the Obion site, or "Work Farm" (Garland 1992:7). Their

results were never published, but a preliminary report was prepared by Merwin (1913), as was a manuscript, which was intended to be a chapter in Myer's *Stone Age Man* (Merwin 1923).

Another significant figure in early twentieth-century Southeastern archaeology is Clarence B. Moore. Using his steamship the *Gopher*, Moore (1915, 1916) conducted excavations along the lower Tennessee River, as well as along the Mississippi River.

During the period between 1910 and 1930, modern excavation techniques, such as the use of a grid and establishment of stratigraphic control, became standard procedure. The marriage of archaeology and anthropology was accomplished during this period, and by 1935 seven universities offered Ph.D. programs in anthropology. Professional archaeological organizations began to form during this period, with the Southeastern Archaeological Conference (SEAC) founded in 1932 and the Society for American Archaeology (SAA) founded in 1934.

THE 1930s–1960s

No depression-relief Works Progress Administration (WPA) or later River Basin Survey (RBS) investigations were conducted along the interior drainages of West Tennessee. In 1940, the University of Tennessee revisited the Obion site and conducted additional excavations (Garland 1992:3), and initiated work at the Chucalissa site (40SY1) on the bluffs south of Memphis (Nash 1972). Practically no archaeological research was conducted in the United States during World War II (1941–1945).

Beginning in 1939, the Peabody Museum's Lower Mississippi Survey (LMS) compiled survey data and conducted test excavations at many of the large sites in the adjoining Mississippi alluvial valley (Phillips et al. 1951). The ceramic typology developed by the LMS is the basis for most archaeological phases in the lower valley (Phillips 1970).

The Memphis State University (now the University of Memphis) Department of Anthropology began as an element of the Department of Sociology in 1962 and was correlated with the annexation of the Chucalissa site by the University. Charles H. Nash initiated the anthropology program and established the museum and research facility at Chucalissa, now named in his honor. Since the mid-1960s, the University of Memphis has played a significant role in West Tennessee archaeology, both in the form of cultural resource management (CRM) and research-oriented investigations, as well as training most of the active professional contract archaeologists in West Tennessee. The University of Memphis Anthropological Research Center initiated a series of Occasional Papers in 1965, and past subjects have covered a wide range of topics, including Mastodon excavations in Memphis (Brister et al. 1981); significant excavations of the stratified Spring Creek site (40PY207) on the Tennessee River (Peterson 1973); various excavations at the Chucalissa site (Lumb and McNutt 1988; Nash 1972); conference proceedings (McNutt 1991); as well as cultural anthropology studies.

CULTURAL RESOURCE MANAGEMENT

The scope and intensity of archaeological investigations in West Tennessee, and indeed across the entire Southeast, increased dramatically with the onset of federally mandated CRM studies in the late 1960s. There is an abundance of CRM studies in west Tennessee, but most are small-scale projects with negative findings. Selected significant CRM-era projects in west Tennessee are discussed below.

The Loosahatchie and Wolf river drainages are one of the better-known areas in Shelby County, as a result of Peterson's (1979a, 1979b) systematic archaeological surveys. Peterson's data was derived from a five-percent random sample stratified by primary landform, supplemented by a one-percent intuitive sample. Survey results suggested a relatively high site density, especially

along the terrace margins at the interface of floodplains and uplands, where sites such as Fulmer (40SY527) and 40SY540 are situated.

The construction of SR-385 (Paul Barrett Parkway) generated a significant amount of survey data by both Panamerican Consultants, Inc. and Garrow & Associates (Collins et al. 1994; McNutt 1995; McNutt et al. 1994; Oliver et al. 1993), as well as testing of four prehistoric sites, including 40SY540 (Walling et al. 1996) and 40SY525–40SY527 (Weaver et al. 1996). Data recovery excavations were conducted at the Fulmer site, located on a terrace edge above the Loosahatchie bottoms (Weaver et al. 1999). The Fulmer site's shallow midden yielded significant data regarding Early Woodland (Tchula) period ceramic technology and intra-site patterning; see Woodland period below. Small, contemporary single-component sites in settings similar to Fulmer are frequent within the Holly Springs National Forest as well (Peacock 1996).

McNutt's (1995) survey of two proposed SR-385 corridor options from I-40 south, around Eads to Mt. Pleasant Road, is another more relevant survey conducted to date along the Shelby-Fayette county line. During this SR-385 survey ten previously unrecorded archaeological sites and one isolated find were documented. Two mid-nineteenth-century sites (40SY549 and 40FY233) and one Woodland site (40FY236) were recommended as potentially eligible.

Another important eastern Shelby County archaeological project was funded by the Tennessee Department of Transportation (TDOT) as a result of the widening of US-64. TDOT archaeologist Zada Law conducted the initial corridor survey in 1989. The most significant result of this project was the excavation of the Carr House, or the Morning Sun Farmstead (40SY508) by Garrow & Associates (Weaver et al. 1990).

TENNESSEE DIVISION OF ARCHAEOLOGY

The Tennessee Division of Archaeology (TDOA) is a branch of the Tennessee Department of Conservation, established by the Tennessee Legislature in 1970 (Tennessee Archaeology Act, Tennessee Acts, 1970, Chapter 468; Tennessee Code Annotated 11-6-101). The TDOA was formed with a Director (State Archaeologist), three regional archaeologists, and an advisory council; the structure has since been revised. Amendments to these bills were passed in 1973 and 1984. The TDOA maintains the site files and has conducted an enormous amount of archaeological work in Tennessee. Although some of their investigations remain unpublished, manuscripts for most of these unpublished investigations are on file in Nashville. Selected prehistoric TDOA projects in West Tennessee are reviewed below and are followed by a review of historic projects.

The Pinson Mounds on the South Fork were an early focus of the TDOA's activity in West Tennessee. In 1974 the Pinson Mounds State Park was formed, and a two-year testing program was initiated (Broster and Schneider 1975). Subsequent research has clearly demonstrated that the Pinson Mounds represent a unique Middle Woodland ceremonial center (Mainfort 1986; Mainfort 1980; Mainfort et al. 1982). In a related study, Broster and Schneider (1977) conducted a site survey of the South Fork in the vicinity of the Pinson Mounds.

Broster (1975) conducted one of the earliest surveys in West Tennessee along a portion of the Middle Fork of the Obion River. Eight sites were located in Weakley and Henry counties; one of these, 40WK52, was suggested to be a significant Middle Woodland habitation.

In 1985, the TDOA surveyed selected localities within the Obion-Forked Deer Drainages under contract with the U.S. Army Corps of Engineers (USACE), Memphis District (Mainfort 1985). Two of these tracts were located on the Middle Fork and one on the North Fork.

From 1991 to 1993, a survey of 3,332 ac. of wetland mitigation lands associated with the USACE, Memphis District West Tennessee Tributaries Project was conducted by TDOA personnel (Mainfort 1994). The project covered numerous non-contiguous tracts located within the Obion-Forked Deer Basin, with a concentration of effort adjacent to the confluence of the Middle and South Forks of the Obion River. Relatively few sites were identified within the mitigation lands (11 newly recorded sites and 11 revisited sites) (Mainfort 1994:73–90). Similar to Anderson et al.'s (1987) methods, survey work was continued outside the project area, resulting in the identification of an additional 12 sites (Mainfort 1994:91–95). Operating under a modified interpretation of the Memorandum of Agreement, test excavations or other activities were carried out at 40GB41, 40GB42, the Kenton Mound group (40OB4), the Chandler site (40CL64), the Barner site (40WK83), and the Oliver site (40OB161), all of which were located outside the project area. The most outstanding results of this project include: (1) the formulation of a well-defined ceramic typology for Tchula and Middle Woodland ceramics, which has general utility for the region (this typology supersedes an earlier attempt at such that has been heavily criticized as being non-replicable); and (2) the reporting of data regarding the Emergent Mississippian occupation of the upland in the Obion River drainage.

Historic archaeological studies conducted by the TDOA in West Tennessee have been largely focused on Civil War sites. Extensive excavations were conducted at Fort Pillow in Lauderdale County during the period from 1976 to 1978 (Mainfort 1980). These investigations resulted in the identification of structural features and a variety of domestic and military artifacts. In 1992–1993 a survey for Civil War period military sites in west Tennessee was conducted (Prouty and Barker 1996). This survey resulted in the documentation of 84 previously unrecorded Civil War military sites and revisits of five previously recorded sites.

Fieldwork for a historic site survey of the state was conducted by the TDOA in 1979 (Stripling 1980). This study sampled various counties from the major physiographic regions of Tennessee, with Gibson County being representative of the Coastal Plain. The 1877 D.G. Beer's Map of Gibson County was extensively used to predict historic site locations.

S. Smith initiated a search for San Fernando in Memphis's Pinch District in 1980 (S. Smith 1980, 1982). Another TDOA contribution to historic archaeology to note is the publication of S. Smith's (1996:14) bibliography of historic archaeology.

PREHISTORIC SEQUENCE

Following is a summary of the prehistoric and historic cultural sequence of West Tennessee. Each of these periods is defined by characteristic artifact assemblages and patterns of subsistence and settlement. The prehistoric period in the southeastern United States is traditionally divided into four major periods: Paleoindian, Archaic, Woodland, and Mississippian.

PALEOINDIAN PERIOD

Paleoindian occupations represent the first well-accepted occurrence of humans in the Western Hemisphere. These populations are generally thought of as highly adaptive, mobile hunter-gatherers whose recent ancestors were Upper Paleolithic Siberians who migrated across the present Bering Strait during the Late Pleistocene when sea levels were ca. 60 m lower. During the Late Glacial era, when initial human colonization of the Southeast is postulated (ca. 10,000–8,000 B.C.), climatic changes followed the receding of the continental ice sheets, and there was a widespread extinction of megafauna. The environment at this time is usually interpreted to have been spruce and/or pine-dominated boreal forest (Saucier 1978). By 1,000 years prior to the fluted point occupations, the environment had changed to deciduous forest (Delcourt et al. 1980).

Research on Paleoindian diagnostics (Anderson and Sassiman 1996) indicates that the period may be subdivided into Early (ca. 9,500–9,000 B.C.), Middle (ca. 9,000–8,500 B.C.), and Late (ca. 8,500–8,000 B.C.) stages, based on changes in hafted biface morphology.

Aboriginal groups of the period were likely small, mobile bands dependent upon a hunting-and-gathering economy. Although they may have hunted some of the megafauna that became extinct at the end of the Pleistocene, such as mastodon (*Mammot americanum*), bison (*Bison bison antiquus*), and ground sloth (*Megalonyx* sp.), it is likely that the subsistence base was varied and included a number of plant and animal foods. One of the nearest firm associations of a fluted point with mastodon remains is well north of West Tennessee at the Kimmswick bone bed in Missouri (Graham et al. 1981), although a possible association at Mississippi River Island No. 35 to the south should be noted as well (Williams 1957). No artifacts are associated with the Nonconnah Creek Mastodon find (Brister et al. 1981).

DALTON PERIOD

The Dalton period is considered transitional between the Paleoindian and Archaic traditions. The key distinguishing feature of the material culture is the unfluted, serrated Dalton point, but the Dalton tool kit includes a number of other diagnostic special-function tools and a woodworking adz (Morse and Morse 1983, 1996). Dalton points recovered from a Forked Deer River context are noted by G. Smith (1996:101) as being long, thin forms with only a minimal amount of constriction in the hafting area. Goodyear (1982) suggests that Dalton represents a distinct temporal horizon dating to 8500–7900 B.C. While technologically similar to Paleoindian, Dalton assemblages suggest an adaptive pattern more akin to later Archaic cultures. One of the most important game species from this time to the contact era seems to have been the white-tailed deer (Morse and Morse 1983:71). During the Dalton period, the Mississippi River meander system was established in the lower valley and was working northward, but a braided stream regime still existed.

Dalton components are better represented in northwestern Tennessee than are the preceding Early and Middle Paleoindian diagnostics, although much is yet to be learned about this temporal period. Mainfort (1996b:80) notes that the only two examples of Dalton components recovered from the Reelfoot Basin of extreme northwestern Tennessee were collected from predominantly Mississippian-component sites. Sites 40OB123 and 40OB127, approximately one mile apart, have yielded one Dalton artifact each. Mainfort further notes that a “fairly large Dalton site” has been reported by a local collector in the Reelfoot area, although the location of that site has yet to be determined. In Fayette County, G. Smith (1996:101) notes the presence of a Dalton component in a relatively shallow context at 40FY13.

In the 1960s, the Ford-Redfield survey project identified a concentration of Dalton components in northeast Arkansas (Redfield 1971; Redfield and Moselage 1970). Important sites such as Brand (Goodyear 1974), Sloan (Morse 1975), and Lace (Morse and Morse 1983) produced evidence for some of the oldest cemeteries in the New World and revealed other features interpreted as living floors and shelter remains. The distribution of sites and site types along the major drainages has also led to the formulation of competing settlement-pattern models for band-level societies (Morse 1975, 1977; Price and Krakker 1975; Schiffer 1975), which have been succinctly commented upon by McNutt (1996:191–192).

ARCHAIC PERIOD

The Archaic is usually thought of in terms of three subperiods: Early (ca. 8000–5000 B.C.), Middle (5000–3000 B.C.), and Late (3000–1500 B.C.). Temporal divisions of the Archaic are primarily based on the occurrence of distinctive projectile points. Throughout Archaic times a hunter-gatherer lifeway appears to have continued, and it was focused on essentially the same flora and fauna as represented in the natural environment today. The Archaic is perceived as a

time of regional “settling in,” when an efficient utilization of the environment was keyed to highly cyclical, repetitive seasonal activities continued by indigenous groups over thousands of years (Caldwell 1958). Some seasonal movement to exploit econiches was probably required, but Archaic populations, compared to Paleoindian, are generally portrayed as being attached to localities, river valleys, or regions. A total of 31 sites with known or probable Archaic components have been recorded in the Reelfoot Basin of extreme northwestern Tennessee (Mainfort 1996b:80). Additionally, numerous other sites with Archaic components have been recorded in all the major river valleys in West Tennessee (Smith 1979). Relatively little is known about this temporal period in this area of the Southeast. In the Central Mississippi Valley, virtually no Archaic sites have been excavated, and indeed these components appear to have been overlooked by archaeologists more concerned with ceramic-period adaptations (McNutt 1996:194; Williams 1991).

Concerning the Early Archaic period, McNutt (1996:194) notes that “we can see several projectile points coming into the Valley from the west and north, probably in conjunction with the prairie expansion and dry econiches during the Hypsithermal.” Point forms considered diagnostic for the Early Archaic include Big Sandy, Hardin, Plevna, and Lost Lake (G. Smith 1996:101). For northeast Arkansas, Morse and Morse (1983) proposed a series of horizon markers that grade from classic Early Archaic Corner Notched forms (ca. 7500–7000 B.C.) into Middle Archaic Basal Notched forms.

The Middle Archaic period was marked by a shift in subsistence modes. This was possibly due to environmental changes caused by a climatic episode called the Hypsithermal, which is dated 7000–3000 B.C. (McNutt 1996) or 8000–4000 B.C. (Morse and Morse 1983). This change resulted in restricted deciduous forest occurrence, limiting the availability of certain floral and faunal resources. The cultural impact of this warming trend appears to have been most strongly felt from 5500–3500 B.C. Several settlement models regarding human adaptation during the climatic optimum have been posited. Morse and Morse (1983) propose that the western lowlands of northeastern Arkansas were largely abandoned for the uplands (Ozark Plateau and its escarpment). However, in the lower Tennessee/Cumberland region, populations appear to have congregated at a limited number of floodplain locations, producing deep middens (Nance 1987). Higgins (1990) proposed that the drying of the uplands forced people into the floodplain (American Bottom). Cypress Creek II, Eva, and perhaps some side-notched forms are noted as the diagnostic point forms from this temporal period (G. Smith 1996:101).

The Late Archaic began at the end of the Hypsithermal climatic episode (ca. 3000 B.C.) and the establishment of the modern climatic regime. The Mississippi River was by then a well-entrenched meander belt-type fluvial system, and adapting to this type of environment was critical for human occupation. There is evidence for more sedentary lifeways, and possibly limited horticulture was being employed, like sunflower, squash, and other cultivated native starchy seed annuals appear in the archaeobotanical record at this time in the other areas of the Southeast. Late Archaic settlement models typically have a seasonal round aspect, and there is evidence that the substantial “winter” villages, typically located on major streams, were actually occupied year-round. Both earthen and shell mounds appear in the archaeological record in the Southeast at this time.

The Late Archaic is characterized by a substantial increase in the number of sites, cultural elaboration, and widespread trade. The period opened with the Benton culture, represented in the diagnostic material record by the Benton projectile point. G. Smith (1996:102) notes that two sites in West Tennessee yielded settlement-pattern information regarding Benton culture. The geographical positioning of these sites appears to represent a Benton trend toward the habitation of low stream terraces in West Tennessee. Excavations at 40FY13 and 40GB42 revealed a heavy dependence on mast-bearing species such as the hickory, and 40FY13 further revealed Benton structural remains, interpreted as bent-pole rectilinear to ovate dwellings.

Flexed burials at 40GB42 are at present tentatively tied to the Benton component at this site. Subsequent cultures of the Late Archaic in West Tennessee are very poorly understood. Such cultures may be represented by the Bartlett and MacIntire, *variety A* projectile points as described by Smith (1979), although little is known about the Late Archaic cultures that produced these lithic artifacts.

POVERTY POINT

Poverty Point, or Terminal Late Archaic, components are distinguished by the appearance of large mounds, earthworks, clay balls or "Poverty Point Objects," microlithics, lapidary work, raw material trade, and specialized manufacturing sites. The Poverty Point period (1500–500 B.C.) is considered one of three cultural peaks in prehistoric Southeastern studies. In other portions of the Southeast, these components are referred to as Gulf Formational (Walthall 1990 [1980]) and include fiber-tempered ceramics as a diagnostic (Morse and Morse 1983:124). In West Tennessee, fiber-tempered ceramics occur only occasionally in the Nonconnah and Lambert complexes of the Terminal Late Archaic and most likely represent trade items obtained from groups farther to the south (G. Smith 1996:104).

Midden mounds and gathering camps appear in the archaeological record at this time and reflect semi-sedentary populations (McNutt 1996; Morse and Morse 1983). G. Smith (1996:104) notes the presence of a Lambert complex component at 40FY13, possibly representing a Terminal Late Archaic mast-collection site. Site 40GB42 yielded similar components, although there they are attributable to the Kenton complex of the Terminal Late Archaic.

Clay balls are thought to have been a substitute for boiling stones and have considerable time depth, apparently extending into the early Middle Woodland; thus, they cannot be used as exclusively Poverty Point component markers. A variety of stemmed projectile points are characteristic of the period, including Burkett-Etley-Gary forms, similar to Ledbetter-Pickwick-Mulberry Creek points, and the Weems-Wade-Dyroff-McIntire forms, which led into the Early Woodland.

Smith (1979, 1996; Smith and McNutt 1988) has repeatedly proposed a series of Poverty Point complexes for the interior drainages (loess region) of West Tennessee. The nine complexes he delineates are based primarily on pre-1975 fieldwork (see *Cultural Resource Management* above). His complexes are spatially discrete and distributed along the terraces of the smaller river bottoms that characterize the region. They are distinguished by variations in baked clay ball and preliminary projectile point types and varieties. The complexes are akin to phases and have been strongly criticized by Mainfort (1994), who remarks, "While such a fine-scale typology may be useful, Smith does not demonstrate its value beyond documenting intra-regional variation and even that may be premature considering the fact that most of the data are derived from surface collections" (Johnson 1993:67).

WOODLAND PERIOD

During the Woodland period, intensification in horticultural methods, construction of earthworks, elaboration of artistic expression, and burial rituals are all thought to be related to the reorganization of social structure. For at least part of the year, a sedentary group was needed to plant, tend, and harvest crops. Sedentism and communal labor efforts promoted territorial circumscription. This period was also characterized by increased variety and use of ceramics. Ceramic types and varieties thus are a primary consideration in interpreting settlement patterns and chronological progression of the Woodland period. Considerable archaeological attention has been focused on these ceramic cultures, and a number of phases and phase sequences have been proposed. However, the reader should be aware that these phase assignments are highly problematic and have received strong criticism in the recent past (Mainfort 1994).

The Early Woodland or Tchula period is viewed by G. Smith (1996:104–105) as a continued occupation by the distinct cultural complexes of the previous Poverty Point period. Tchula period diagnostic ceramics, including Tammany Punctated, Cormorant Cord Impressed, Twin Lakes Punctated, and Withers Fabric Impressed, are poorly represented in the archaeological assemblage from West Tennessee and Kentucky (Lewis 1996:51–53; Mainfort 1996a:81–82). According to Mainfort and Lewis, this poor representation is most likely attributable to the lack of temporally specific research projects aimed at the recovery of data regarding Tchula period occupations.

The most intensively investigated Early Woodland component in West Tennessee is the Fulmer site (40SY527), located on a finger ridge on the margin of the Loosahatchie floodplain near Arlington, Tennessee (Weaver et al. 1996). Approximately 62 percent of this small, essentially single-component open-habitation site was formally excavated, resulting in detailed data regarding Tchula period site structure. Activity and midden areas in the lee of the prevailing wind around a central hearth were suggested by artifact distributions. Numerous reconstructed vessel sections recovered here revealed that the conoidal bowl/beaker was overwhelmingly the most common vessel form (n=35), followed by medium jars (n=11), large flaring-rim bowls (n=5), and other bowl and jar forms. Fabric impression was the most common surface decoration, but slipped, punctated, and cord-impressed vessels were also manufactured, often with folded rims. Several ¹⁴C samples were dated, but the resulting dates (A.D. 970, 980, 1060, 1520, 1750, and 1780; uncalibrated) were considered invalid (i.e., rejected). Most features at the site were heavily disturbed by tree roots, rodent burrowing, and other processes, including early-twentieth-century plowing, and the radiocarbon dates may date these post-depositional disturbances. Comparative review of the regional literature led the authors to suggest that Fulmer was affiliated with the Turkey Ridge phase of the Lake Cormorant Horizon, with a likely occupation ca. 400–100 B.C.

Another important late Tchula period component is a large site within the Reelfoot Basin, the MacDonald High site (40LK44). This site may have originally contained as many as 40 mounds; however, it has now been completely destroyed by agricultural activity (Mainfort 1996b:81–82).

The Middle Woodland period featured elaborate burial ceremonialism and artistic expression and represented the second major cultural zenith in the prehistoric Southeast. In the Ohio Valley, the Middle Woodland period is referred to in terms of Hopewell, while in the Lower Mississippi Valley, this period is characterized as Marksville. Diagnostic ceramics from the Middle Woodland period include sand-tempered ceramics, including Marksville Stamped and Marksville Incised (McNutt 1996:213). Two major Marksville sites are located within the Reelfoot Basin of southwestern Kentucky: the Amberg and Hickman Earthworks, 15FU37 and 15FU39–44, respectively.

The major Middle Woodland site of the region is Pinson Mounds (40MD1). Originally considered to be a Mississippian period site, subsequent archaeological investigations at Pinson (Fischer and McNutt 1962; Mainfort 1980; Morse and Polhemus 1963) have provided ample radiocarbon dating evidence for a Middle Woodland temporal assignment. Site 40MD1 is interpreted as a large Middle Woodland ceremonial center utilized by “relatively small groups of semi-sedentary peoples” (Mainfort 1986) on a seasonal and/or infrequent basis. Middle Woodland settlement-pattern information has also been recovered (Broster and Schneider 1977) from 23 sites in the vicinity of Pinson.

The Late Woodland or Baytown period represents a period of change characterized by a population increase accompanied by decentralization and the continuing adaptation of agriculture to riverine environments (B. Smith 1986). Both characteristics of this temporal period may have represented a response to the over-exploitation of local resources (McNutt 1996:217). Diagnostic Late Woodland ceramics consist entirely of clay-tempered types, including Baytown

Plain, Mulberry Creek Cord Marked, and Larto Red Filmed (Phillips 1970). Morse and Morse (1983) note that small, triangular projectile points such as the Hamilton and Madison types are diagnostic of the Late Woodland period and subsequent temporal periods as well. However, the general paucity of lithic artifacts from the Late Woodland may be related to the introduction of the bow and arrow ca. 700 A.D. (Blitz 1988), which may have reduced “the production of stone points to near zero” (Dunnell and Feathers 1991:26).

MISSISSIPPI PERIOD

Hallmarks of the Mississippi period include population increase, intensive floodplain settlement, greater emphasis on agricultural activity, earthwork construction on celestial alignments, inter-regional exchange of exotic items, shell-tempered ceramics, and possibly bow warfare. These factors and the development of a distinctive elite iconography are associated with the rise of conscripted, complex sociopolitical systems, which we now refer to as chiefdoms. A complex mosaic of competing chiefdoms dominated the late prehistoric Southeast political landscape. These chiefdoms were documented by the Spanish explorers at the close of the Mississippi period, which is the final zenith of Native American cultural development.

Early Mississippian cultures initiated a shift toward the production of sparse shell-tempered ceramic vessels, construction of rectilinear domestic structures, and a heavy dependence upon maize-based agriculture for subsistence. The distribution of Early or “emergent” Mississippian occupations on the loess sheets of northwestern Tennessee is relatively poorly understood when compared to the remainder of the Central Mississippi Valley, with the exception of the Samburg (40OB1) and Foxhole (40LK10) sites in the Reelfoot Basin. Further south, however, excavations at the Shelby Forest site (40SY489) revealed a Varney horizon occupation, the earliest cultural horizon in the Mississippi period, characterized by a prevalence of red-filmed ceramics (Varney Red) in the assemblage (McNutt 1988, 2015; McNutt and Fain 1990).

The Middle Mississippi period is characterized by the appearance of palisade-fortified villages, geographically expressed across the landscape in relation to an increasing adaptation to maize agriculture. Population density, house and storage pit size, vessel forms, and tool types visible in the archaeological assemblage further reflect an adaptation to and concentration upon agrarian subsistence (McNutt 1996:230). Middle Mississippian components in West Tennessee are, once again, poorly understood in comparison to surrounding areas. Two sites in the Reelfoot Basin, 40LK2 and 40LK3, offer the only Middle Mississippian occupational expressions in this portion of the state. Not until traveling much farther south does one encounter evidence of another Middle Mississippian occupation, the Chucalissa site (40SY1), located in extreme southwest Tennessee.

The Late Mississippi period represents the final prehistoric cultural climax in the southeastern United States and is predominantly characterized by a wide variety of elaborately decorated ceramic vessel types. A large number of Late Mississippian sites have been located and investigated in western Tennessee, although a surprising amount of information has yet to be published regarding these sites (Mainfort 1996a:172). G. Smith (1996:112–117) has defined three primary phases of the Late Mississippi period in West Tennessee. Smith’s phases include (1) the Walls Phase, located in extreme southwest Tennessee and northern Mississippi; (2) the Tipton Phase, located in middle West Tennessee; and (3) the Jones Bayou Phase, located immediately north of the Tipton Phase, representing the closest of these three phases to the current project area. Mainfort (1996a) presents the most complete account of this temporal period for West Tennessee to date, although he notes that much work is needed before a complete understanding of the Late Mississippian cultures will be possible. Important Late Mississippian sites in West Tennessee include Sweat, Porter, Jones Bayou, Fullen, Graves Lake, Hatchie, Richardson’s Landing, Wilder, Rast, Jeter, and Chucalissa. However, northwestern

Tennessee is relatively devoid of Late Mississippi period sites, a notion that has been addressed by Williams (1980, 1990) in his “Vacant Quarter Hypothesis.”

PROTOHISTORIC PERIOD

This period is generally considered to have begun with the first appearance of European peoples in the Southeast. The de Soto expedition is thought to have crossed the Mississippi River near Walls, Mississippi, in June 1541, after following an upland trail from their 1540 winter camp with the proto-Chickasaw in northeast Mississippi (Dye 1993). Sites along the Mississippi River that were occupied after initial European contact have been termed Armored phase components, and a number of horizon markers are proposed (Williams 1980).

Protohistoric sites in West Tennessee (A.D. 1541–1650) produce low frequencies of European trade goods (rarely Spanish, more typically French beads and brass) in association with Late Mississippian artifact types, including quantities of the ceramic type Campbell Appliqué (Mainfort 1996b:179). Protohistoric components are relatively infrequent in comparison to southeast Missouri and northeastern Arkansas and are essentially absent from the interior drainages of the loess sheet. The key sites for this period in West Tennessee, Otto Sharpe, and Graves Lake are both located near the Mississippi River.

HISTORIC ABORIGINAL PERIOD

Terminology seventeenth-century aboriginal occupations as “historic” versus “protohistoric” is a rather arbitrary division, and by this point, Native American culture had irreversibly changed from pre-European contact lifeways. While West Tennessee is noteworthy for its general absence of historic aboriginal tribes, the region was claimed as a hunting ground by the Chickasaw as well as by the Cherokee (Satz 1979:11).

Middle Tennessee was occupied by the Shawnee in 1685 when the French established a trading post at a salt lick that later developed into the city of Nashville. At about the same time, in 1686, the French also established Arkansas Post near the Quapaw village of Osotouy. The Shawnee presence in the Cumberland River Valley brought them in persistent conflict with other groups from all sides (Cherokee, Chickasaws, and Iroquois), and early in the eighteenth century, the Shawnee were driven from their Cumberland villages (Satz 1979:12). During their migration, the Shawnee may have temporarily established villages in West Tennessee before settling on the Ohio River.

In 1700, a Frenchman, Father Gravier, encountered a canoe of Taogria (Yuchi) on the Mississippi River, somewhere below the mouth of the Ohio, who had been trading with the Akansa (Quapaw). In 1701, five Canadians apparently visited the Taogria Yuchi town, which was located on an island in the lower Tennessee River, near Muscle Shoals (Swanton 1922:297). These Yuchi likely moved up the Tennessee River in the first decade of the eighteenth century, and by 1712 the South Carolina Board of Indian Trade Affairs noted the presence of “Uche or Round Town people” among the Overhill Cherokee in East Tennessee (Swanton 1922:297).

HISTORIC ERA

COLONIAL PERIOD

In the waning sixteenth and seventeenth centuries, more or less continuous contact was established between European and aboriginal populations. Initial Spanish, French, and English settlements were all located on the coast. The English established Jamestown in 1607, and in 1609 King James I granted a charter to the London Company for a vast region that included present-day West Tennessee. The coastal Virginians armed the local Westo Indians, who proceeded to raid the Muscogee, or Creeks, who lacked firearms (Braund 1993:28). Such direct

and indirect European-induced social disruptions, such as introduced disease (Ramenofsky 1987), would characterize the entire colonial period and lead to shifting allegiances as the European powers struggled for territory and profits in North America.

In 1665, all land south of 36° 30' was granted to the Lord Proprietors of Carolina by King Charles II. The English established Charlestown in 1670, and in 1685 Henry Woodward's packtrain traveled overland from Charlestown to the Lower Creek towns, an act that is generally regarded as the formal opening of the English deerskin trade.

In the early eighteenth century, the deer and slave trades continued to expand as interior aboriginal populations became increasingly dependent on European goods such as flintlock muskets, metal tools, and textiles. Carolina companies "reaped huge benefits as hides and furs from interior tribes soon became the colony's major export" (Braund 1993:29). For example, in the period from 1699 to 1705, Charleston traders shipped an average of 45,000 deerskins annually to London. Above we noted that in 1701 a group of French Canadian traders ascended the Tennessee River.

While deerskins were the staple exchange, the sale of captive enemies was also profitable, fostering the breakdown of ancient traditions and a profound change in the nature of aboriginal warfare. Western groups such as the Choctaw and disrupted, weak coastal groups became targets for Creek-English slave raids.

During the 1740s, tensions between the colonial powers mounted, and alliances with Indians were critical for seizing and holding both territory and deerskin-trading profits. The French launched raids on the Chickasaw during 1736–1740 in retaliation for Chickasaw raiding of their shipping (primarily Illinois wheat-laden barges) on the Mississippi. In 1739, Fort Assumption (now Memphis) was built by the French on the Chickasaw Bluffs in an attempt to curb the Chickasaw. Also, at about this time, the introduction of significant numbers of Negro slaves began along the coast, supplying the colonists with a more stable and controlled supply of labor.

In 1756, the French and Indian War (Seven Years' War) broke out, partly as a result of French efforts to fortify the Ohio Valley. France was defeated and signed the Treaty of Paris on February 10, 1763, ending the war. However, the English colonists were still forbidden to settle west of the Appalachians. English traders began infiltrating pro-French tribes in Louisiana in the 1770s; for example, in 1773, a Quapaw chief adopted an English trader, and they attended a conference at Pensacola together (Arnold 1991:109).

No significant activity took place in West Tennessee during the American Revolution. The nearest engagement was apparently the Englishman James Colbert's attack on Arkansas Post with a Chickasaw war party in April 1783 (Arnold 1991:111–112). This action took place well after Cornwallis surrendered at Yorktown (October 1781), essentially forcing the British to abandon the war effort and sign a preliminary peace treaty at Versailles in November 1782. The peace treaty that ended the American Revolution was formally ratified in Paris on September 3, 1783.

After the American Revolution, significant numbers of settlers from North Carolina and Virginia began to migrate over the Blue Ridge mountains into Tennessee and Kentucky. Tennessee at this time was part of North Carolina, as specified in the charter issued by the British Crown. In 1785, there were significant tensions between the settlers in the Cumberland and the legislators in North Carolina; a separate assembly was formed, resulting in the birth of the "Lost State" of Franklin (Gerson 1968:36). In 1790, George Washington established the Territory of the U. S. South of the River Ohio, which provided a formal federal separation. In 1796, Tennessee became a state.

ANTEBELLUM PERIOD

The early nineteenth century is better understood and represented in the archaeological record in Middle and East Tennessee, as this is where most settlements were located. In 1812 West Tennessee was rocked by a series of massive earthquakes known as the New Madrid earthquakes (Fuller 1912). The town of New Madrid, Missouri, was destroyed, Reelfoot Lake was formed, and the aftershocks continued for months. After the War of 1812 ended (in 1815) and the British-Creek Confederacy was defeated, immigration increased again.

In 1818 the Jackson Purchase Treaty resulted in the acquisition of West Tennessee from the Chickasaw Indians in Mississippi. Shelby County was created by the Tennessee General Assembly on November 24, 1819. The county is named for Issac Shelby, one of the Jackson Purchase Treaty commissioners. Neighboring Fayette County was established by the Tennessee Legislature on September 19, 1824, and was named for Marquis de Lafayette, the French general and statesman (Morton 1998). Settlement of the area along the Shelby-Fayette county line began as early as 1820. Memphis, the largest city in Shelby County, was laid out in 1819 and incorporated in 1826.

Early settlements in east Shelby County include the following (Davies-Rodgers 1990; Magness 1994; Van West 1998). The log house that would later become Davies Manor in Brunswick was built in 1807. In 1825, Frances Wright founded the utopian plantation, Neshoba, on 2,000 ac. along the Wolf River. The plantation failed in 1829. The Memphis to Somerville Stage Road (now US-64) was authorized by the Shelby County Court in 1826. In 1830, the Morning Sun Post Office was established in the Wash Store, located at the intersection of Seed Tick and Old Stage Coach roads. Stephen Jones, Jr. moved his family from Halifax County, Virginia, to Brunswick around 1835. A log house was built by Stephen’s son, Russell, around 1860 that still stands today. In 1835, Thomas C. Crenshaw built Mt. Airy, a two-story plantation home southeast of Morning Sun. Other plantations, such as the Eklin family’s Woodlawn, existed in east Shelby County in the 1830s. The Davies Plantation was not acquired by the Davies family until 1851, but the “manor” had been added to the log cabin by 1831.

Historically, the economy of northern and eastern Shelby County was based on agriculture, in particular cotton and corn production (Morton 1998:303). Large plantations and small farms existed throughout the county and the adjacent sections of Fayette County. During the Antebellum era, the plantations were worked using slave labor, and the slave population of the county rose steadily during 1830-1860 (Table 3-01). During the early 1800s, the Shelby County population lagged behind that of the neighboring Fayette County. However, the rise of Memphis as an important river port eventually led to Shelby County becoming one of the populated areas of the state. On the eve of the Civil War, black slaves formed 26 percent of the Shelby County population, while they formed more than 63 percent of Fayette County’s total population. The eastern portions of Shelby County (i.e., rural areas outside of Memphis) were more akin to Fayette County.

Table 3-01. Antebellum census data for Shelby and Fayette counties.

Census	Shelby County Total Population	Shelby County Slave Population	Fayette County Total Population	Fayette County Slave Population
1830	5,648	2,049	8,652	3,178
1840	14,721	7,043	21,501	10,885
1850	31,157	14,360	26,719	15,264
1860	48,092	16,953	24,327	15,473

The Ames Plantation, located near LaGrange, has been the focus of historical archaeological research (Byrne and Moreland 2007; DuVall and Evans 1995). The Ames Plantation covers 18,600 ac. and 190 sites that promise to reveal new clues about the social and economic lives of enslaved people. During the first season of work, a collaborative team surveyed and excavated at the Holcombe plantation (40FY446). This mid-sized plantation is well attested in the historical record, including published diary entries by a resident of the manor house from the 1830s.

Railroad development came in the 1850s. The Memphis to Charleston Railroad construction began in 1852 (Magness 1994:213). By 1853 the tracks reached Moscow. The line was completed in 1857, connecting Memphis directly with the Atlantic Coast for the first time. The Memphis and Ohio Railroad was established through Shelby Depot (Brunswick after 1880; Davies-Rodgers 1990:123). This became part of the Louisville and Nashville (L&N; now Seaboard) Railroad.

CIVIL WAR AND RECONSTRUCTION

Following Lincoln's election, the initial vote for secession failed, but after the war began, Tennessee seceded. In 1861–1862, several skirmishes took place along the Mississippi during the Federal campaign to seize control of the river. New Madrid was captured by Confederate forces under General Pillow in 1861. Island No. 10 was fortified by the Confederates and was the scene of a battle in March 1862 (Daniel and Bock 1996).

Fort Pillow was originally constructed just above the mouth of the Hatchie River by Confederate forces in 1861 but was abandoned and seized by Union forces in June 1862. Also, in June 1862, the Federal forces captured Memphis. In April 1864, the Confederate cavalry, under General Forrest, raided Fort Pillow and routed the Union troops. Archaeological investigations at Fort Pillow by the TDOA were mentioned above. Following the battle for Fort Pillow, sporadic guerrilla activity characterized combat of the later war years.

During 1992–1993 TDOA conducted a thematic survey to identify Civil War period military sites in west Tennessee (Prouty and Barker 1996). As a result of this survey, 89 sites were identified, and 19 types of archaeological sites were recognized (Prouty and Barker 1996:22). Thirteen Civil War-era military sites were identified within Shelby County as a result of this study (40SY5, 40SY515–40SY524, and 40SY532–40SY533), and 18 were identified in Fayette County (40FY214–40FY231). A variety of military sites types are reported in Shelby County, but all are associated with the Union Army. The most common site type is “long-term encampment” (n=11). The most significant Civil War period military site in western Shelby County is Fort Germantown (40SY533) (Prouty and Barker 1996:27).

W.G. Brownlow was selected as the governor by the military occupation forces (Folmsbee et al. 1969:353). He took office in April 1865 and immediately disenfranchised all former Confederates. However, owing to the Federal occupation of most of the significantly populated areas of Tennessee (Memphis, Nashville, and Knoxville) for most of the war, Reconstruction was a relatively short affair in Tennessee, ending in 1869.

During Reconstruction, railroad construction began to open the interior portions of Western Tennessee. From 1855 to 1950, communication and transportation became dominated by the railroads. The period is “foremost characterized by a drastic reorganization of non-farming settlement pattern keyed to extremely narrow corridors ... ” (Stewart-Abernathy and Watkins 1982:HA18-19). From an archaeological viewpoint, the Railroad period is summarized as:

... aside from the increased presence of consumer goods and increased general information level, the Railroad period is reflected by scores of nucleated settlements whose end or beginning date

correspond to the coming of the railroad, and by some of the greatest landscape modifications made by people. These modifications take the form of embankments, cuttings, bridges, and support complexes, and exist on an intensive and extensive scale matched only by the construction after 1950 of highways and levees [Stewart-Abernathy and Watkins 1982:HA18-19].

Railroads were critical to the late nineteenth-century development of Memphis as a regional distribution center and transportation hub. Railroad construction boomed after the Civil War, and by 1900 there were 3,131 miles of track in Tennessee (Johnson 1998:771). By the 1890s, most of the railroads in Tennessee were consolidated into three major systems: the Southern Railway Security Company (Southern), the L&N, and the Illinois Central (IC).

TENANT PERIOD

The period 1870–1950 is known as the Tenant period (Stewart-Abernathy and Watkins 1982) and is named for the sharecropping or tenant farm labor system that was a significant characteristic of southern U.S. agriculture after the Civil War. This decentralization of the old plantation system developed during Reconstruction as a means of stabilizing labor relations between former slaves and landowners. Prunty (1955) has interpreted tenancy as a postbellum modification of the plantation system.

Tennessee’s farm tenancy percentage peaked during 1930–1935 at 46.2 percent and was higher than the Southern average (Holley 2000:27). The importance of the Tenant period in the archaeological record is that it represents the maximum occupation of the study area prior to the 1950 developments (see “Lakeland” section below). The dispersed settlement pattern of the tenant period contrasts sharply with the clustered settlement pattern prior to 1865 (Orser and Nekola 1985:68). The tenant settlement pattern can be observed in the 1930s and 1940s aerial photographs, with alignments along roads and bayous at regular spacing. Sites dating to this period are numerous, and the issue of these sites’ NRHP significance status has generated some commentary (Wilson 1990).

The Tenant period is defined as:

...the phase within the history of commercial agriculture in which the rural landscapes dominated by mono-culture are composed of small farms of minimal size operated by white and black renter or sharecropper families. These small farms are tied to the plantation complex and represent a decentralized stage in this development. In this stage the use of capital for the production of a base crop is routed through an extra step consisting of the several families who are responsible for raising the crop. While the direction of capital use and power obviously flows from top to bottom in this stage, the extent to which the tenant family, in fact, exercises control over various of their affairs is problematical, with archaeological implications ranging from source of supply for table ceramics and architectural environment to responsibility for social and physical community patterning and maintenance of ethnic identity [Stewart-Abernathy and Watkins 1982:HA16-HA17].

Stewart-Abernathy (1999:240) has reviewed a number of “intriguing” investigations at tenant farmsteads in the “delta” area around Memphis that were conducted by contract archaeologists. Nearly all of this work was CRM investigations funded by the USACE, Memphis District. Examination of “delta” Tenant period archaeological site data has led to the development of a distinctive “Tenant Period Artifact Pattern” (Buchner 1992) when assemblages are analyzed using South’s (1977) functional groups. While some deviations can be observed in the frequency patterns identified based on surface collected assemblages versus excavated assemblages, in general, the pattern is one where Kitchen Group artifacts dominate. Excavated assemblages tend to produce more nails; thus, the proportional representation of the Architecture group increases at the expense of the Kitchen Group.

The ceramics are typically cheaper types, often from mismatched sets, and many of these types can be identified following Price (1979). Mean ceramic dates (MCDs) are often not calculated for these sites due to the long span of whiteware production, as well as problems relating to temporal lag. Garrow et al. (1989:60) note that “South’s (1977) mean ceramic date formula tends to break down after ca. 1860...the primary reason is that neither manufacturing or popularity date ranges have been firmly established for the post-1860 period.” Only trace frequencies of other artifact groups are found (Arms, Clothing, Personal, Furniture, Tobacco), and in small assemblages, these minority group types are often not represented.

The cultural deposits at Tenant period sites are typically near-surface, often plowzone only contexts, as a result of the buildings being frame structures elevated on brick, concrete, or cypress stump piers. If a house did not have a substantial chimney, it was more likely to be swept away during a flood. Occasionally tenant sites are multi-component (i.e. co-occur with prehistoric material); this is largely dependent on the natural setting of the site. Many Tenant period sites are located on silty clay backswamp soils that were not suitable for human habitation until after drainage improvements were made.

WORLD WAR II

While World War II (WWII) was waged overseas, the war had both immediate and long-term influences on the home front. During WWII, multiple military and industrial facilities were constructed in Tennessee, and these facilities are part of the state’s “Home Front Heritage” (Kelly 2004:40).

The TDOA conducted a survey for WWII military sites in Tennessee and identified five sites in Shelby County: the Memphis General Services Depot (40SY700); Second Army HQ (40SY701); Memphis Naval Air Station (40SY702); the “Wagon Wheel” Airfield (40SY703); Charles W. Baker Field (40SY704); and Kennedy Veterans Hospital (40SY705) (Nance 2007:22). Additionally, Nance (2007:57) identified 16 companies in Shelby County that produced war materials, including the Chickasaw Ordnance Works (COW) in Millington. A portion of the APE is adjacent to Charles W. Baker Field.

4. LITERATURE & RECORDS SEARCH

TENNESSEE DIVISION OF ARCHAEOLOGY

Due to the COVID-19 pandemic, the Tennessee of Division of Archaeology (TDOA) office in Nashville was closed during this investigation. As a result, Andrew Saatkamp contacted Lacey S. Fleming via e-mail to conduct a standard TDOA files check, and she responded on November 18, 2021.

Importantly, this revealed that there are no previously recorded archaeological sites located within the proposed Baker Airport tree obstruction APE. Note however, that a portion of the Baker Airport to the south of the APE is recorded as archaeological site 40SY704 based on archival research. Within a 2 km radius of the APE there are eight previously recorded archaeological sites (Figure 4-01; Table 4-01), and even more just beyond the 2 km search radius. Six of the previously recorded sites are located on elevated terraces flanking the Loosahatchie River floodplain, and in this vicinity this typically means at or above 230 ft. The other two previously recorded sites (40SY802 and 40SY816) within the search radius are in uplands.

Table 4-01. Previously recorded archaeological sites within 2 km of the APE.

Site	Component	Description	NRHP Status	Date
40SY13	Woodland	Village with possible mound on terrace edge overlooking the Loosahatchie River floodplain.	Undetermined	1957
40SY14	Archaic?	Village on terrace edge overlooking Loosahatchie River floodplain (0.25 mi. west of 40SY13).	Destroyed	1957, 2002
40SY225	Archaic-Woodland	Camp on first terrace of Loosahatchie River.	Undetermined	1972
40SY704	1942	Charles W. Baker Airfield/Naval Air Aviation Training Airfield, SY-05.	Undetermined	2006
40SY706	20 th Century	Farmstead with a burned residence and barn on a low terrace overlooking the Loosahatchie River floodplain.	Not eligible	2007, 2014
40SY802	Late 19 th to 20 th Century	A small low-density Historic scatter in uplands along Lucy Road; possibly associated with a structure shown on a 1942 quad.	Not eligible	2018
40SY816	20 th Century	Lucy School; a Rosenwald School.	Undetermined	2018
40SY841	Post 1890	An abandoned rural domestic site on Raleigh-Millington Road.	Not eligible	2019

PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

ANTIQUARIAN ERA

Antiquarians such as Putnam (1973[1878]) and Thruston (1897) were quite active in Tennessee and Kentucky, their efforts were largely focused on monumental earthworks, large villages, and cemeteries along the floodplains of major streams, including the Cumberland, Tennessee, Green, and Ohio rivers, and on some of the better-known caves in karst regions. William Myer's (1971 [1928]) "Archaeological Map of the State of Tennessee" indicates no features in the project area.

Figure 4-01. Distribution of previously recorded sites within 2 km of the APE (base map: 2019 Millington, TN 7.5-min. quad).

LOOSAHATCHIE RIVER SAMPLE SURVEY

The earliest modern archaeological work in the study area was conducted during the late 1970s by Memphis State University (Peterson 1979a). Peterson's (1979a) project was a sample survey, during which most of the 1,921 km² (742 mi.²) Loosahatchie River watershed was stratified into three environmental zones (floodplain, terraces, and uplands) and subdivided into 1-min. quadrants. A 3 percent random sample of the quadrants was surveyed. One of the sample quadrants was located southeast of the APE and another was located southwest of the APE.

Importantly, Peterson's (1979a) results rather dramatically revealed that archaeological sites in the Loosahatchie River watershed are concentrated on terraces, where 3.22 sites were identified per km². In contrast, uplands yielded only 0.49 sites per km² and floodplains even less (0.22 sites per km²). Highly similar results were also documented in the adjacent Wolf River watershed using similar methods (Peterson 1979b). The implication for the Baker Airport tree obstruction APE is that few sites are expected because the expansion area APE is in uplands north of the terrace edge.

STATEWIDE WW II THEMATIC STUDY

During 2006, TDOA archaeologists recorded the Charles W. Baker Airfield as Site 40SY704 as a part of a statewide thematic study of World War II military sites (Nance 2007). The Charles W. Baker Airfield was originally constructed in 1942 (as an adjunct to the Millington Naval Air Station [40SY702]), and was referred to as Naval Air Aviation Training Airfield, SY-05 (Fulbright 1998). It is important to note that the 40SY704 runways do not fall within the property purchase APE (Figure 4-02). The 40SY704 World War II airfield consisted of eight 1,600 ft. (487 m) logn paved runways arranged in a Star of David pattern. This airfield was originally built as an outlying landing field (OLF) associated with the Naval Air Station (NAS) Memphis (which is recorded as Site 40SY702).

The "Wayback Machine" web page http://www.airfieldsdatabase.com/WW2/WW2_R27a_NJ-TN.htm designates this airfield "NAF2106 OLF," and notes that it is now the Barker Airfield and that the "remains of the offset squares are clearly visible." Examination of 1997 to 2020 Google Earth historical images does indeed reveal that all or portions of six of the Star of David "points" or runway end intersections are visible from the air (Figure 4-02). Additionally, one 1,600 ft. long north-south WW II runway remains intact on the west side of the Charles Baker Airfield and is now known as runway 18U/36U. The other seven WW II runways were razed or otherwise removed after 1946 and before 1959, but linear features can be seen at their former locations.

Naval Air Aviation Training Airfield, SY-05 was released to civilian control in 1946, and the Charles W. Baker Airport opened 1959. It was also sometimes referred to as the "Shelby County Airport."

Local aviator Ron Spence curates an undated historic air photo of the Naval Air Aviation Training Airfield, SY-05 and its distinctive Star of David pattern (Figure 4-03).

SEWER SURVEY

During 2006, Cultural Resources Services conducted a survey of a proposed sewer line extension corridor partly located adjacent to Raleigh Millington and Fite Roads (Smith and Smith 2006). This survey resulted in negative findings.

FITE ROAD EXTENSION SURVEY

During 2006, Panamerican surveyed a 2.08-mi. corridor for a proposed extension of Fite Road between US-51 and the Charles W. Baker Airfield (Cruciotti and Buchner 2007). This survey resulted in negative findings but did result in the recovery of some information regarding Armstrong Field, the location where Charles A. Lindburg landed during his U.S. tour following

his historic 1927 solo flight across the Atlantic Ocean. A historic marker for Armstrong Field is located about 3 km west of the Baker Airport APE. Armstrong Field was named for a Memphis pilot killed in World War I, and was dedicated in 1926.

Figure 4-02. Remaining 40SY704 WW II airfield features indicated on a 1997 Google Earth aerial image.

Figure 4-03. Undated historic aerial photo of the 40SY704 WW II airfield, the precursor to Charles W. Baker Airport; view west (image courtesy of Ron Spence).

RALEIGH MILLINGTON ROAD CELL TOWER

During 2007, Weaver & Associates, LLC conducted a survey of a proposed cell tower site located on the east side of Raleigh Millington Road (Stetzer 2007). This survey resulted in the identification of one newly recorded site; a late Historic farmstead (40SY706).

MITIGATION BANK SURVEY

During late 2013, Panamerican conducted a survey of a proposed 405 ac. wetland mitigation bank located on the Loosahatchie River floodplain to the east of Raleigh Millington Road; approximately 1 km southeast of the APE (Buchner et al. 2014). Most of the tract was an agricultural field that was visually inspected. Non-flooded bottomland forest portions of the tract were surveyed using 30 m interval shovel testing. The survey resulted in a revisit to 40SY706, a previously recorded Historic farmstead, that was shovel tested at 10 m intervals. The ca. 1915 residence at the site observed by Stetzer (2007) was found to have been burned down in the interim between the surveys. The archaeological deposit at 40SY706 was documented to be low-density and restricted to a shallow A horizon. Site 40SY706 was recommended as not eligible for the NRHP, and an architectural historian concluded that the standing 1950s barn at the site was not eligible.

ROSENWALD FUND THEMATIC STUDY

During 2015-2018, the TDOA conducted a thematic study of Rosenwald Fund educational facilities in Tennessee that were built specifically for African-Americans (Nance and Eckhardt 2018). Rosenwald Fund constructions in Tennessee included 354 schools, nine teacher homes and ten industrial shops. Shelby County contained a concentration of these facilities because of its high African-American population. The Lucy School (40SY816) was recorded as field site SY-32 on Pleasant Ridge Road to the northeast of the Baker Airport APE during this study.

WOODSTOCK SOLAR FARM SURVEY

During 2018, Cultural Resources Analysts (CRA) conducted a survey for a proposed solar farm south of Lucy Road (Bradbury et al. 2018). This resulted in the identification of six newly recorded sites (40SY797—802), including one site within our 2 km search radius (40SY802; see Table 4-01).

BIG CREEK NATIONAL DISASTER RESILIENCE IMPROVEMENTS SURVEY

During 2019, Panamerican conducted a survey of 225 ac. within a larger flood control project area that will be disturbed by the construction, and another 230.7 ac. associated with three off-site borrow areas (Buchner et al. 2019). The setting was low-lying floodplains along the Big Creek Drainage Canal, with the exception of one borrow area that was on the floodplain of the Loosahatchie River (which Big Creek is a tributary). The basic site detection method included shovel testing at 30-m intervals in areas with restricted surface visibility (< 50 percent) and surface inspection at 15 m intervals in areas with good surface visibility (>50 percent).

The survey resulted in revisits to three previously recorded sites (40SY514, 40SY648 and 40SY664), and the documentation of two newly recorded Historic sites (40SY514, 40SY648) and two newly recorded Historic domestic loci that were not assigned trinomials by the TDOA (Locus 2 and Locus 3). Two these sites are Prehistoric components (40SY514 and 40SY648), three are Euro-American domestic occupations (40SY841, Locus 2 and Locus 3), one is a segment of an early twentieth century road (40SY842), one is several sets of concrete ruins associated with an extensive World War II era gunpowder plant (40SY664).

Panamerican recommended that 40SY664 be considered potentially eligible for the NRHP under Criterion D (Information Potential), as the site could contribute to the archaeological understanding of the World War II era Tennessee Powder Company and Chickasaw Ordnance Works. Avoidance of the 40SY664 loci within the APE was the recommended management treatment plan, however if that was not possible then Phase II testing was recommended. Resources 40SY514, 40SY648, 40SY514, 40SY648, Locus 2 and Locus 3 were recommended not eligible for the NRHP.

TENNESSEE HISTORICAL COMMISSION

Review of the on-line Tennessee Historic Commission (THC) Geographic Information System (GIS) Shelby County database reveals that no properties are recorded within the proposed Baker Airport tree obstruction APE (Figure 4-04). Within a 0.5-mi. radius of the APE there are 20 recorded properties (Table 4-02). Most are single family dwellings constructed during the early to mid-twentieth century. Other property types represented in Table 4-02 include a multi-family dwelling, a church and the Lucy School (also recorded as archaeological site 40SY816), all of which date to the early to mid-twentieth century. The Ward Cemetery is also known as the Ward Memorial Cemetery or the Lucy Cemetery and contains late nineteenth and twentieth century interments.

Table 4-02. Previously recorded THC properties within 0.5 mi. of the APE.

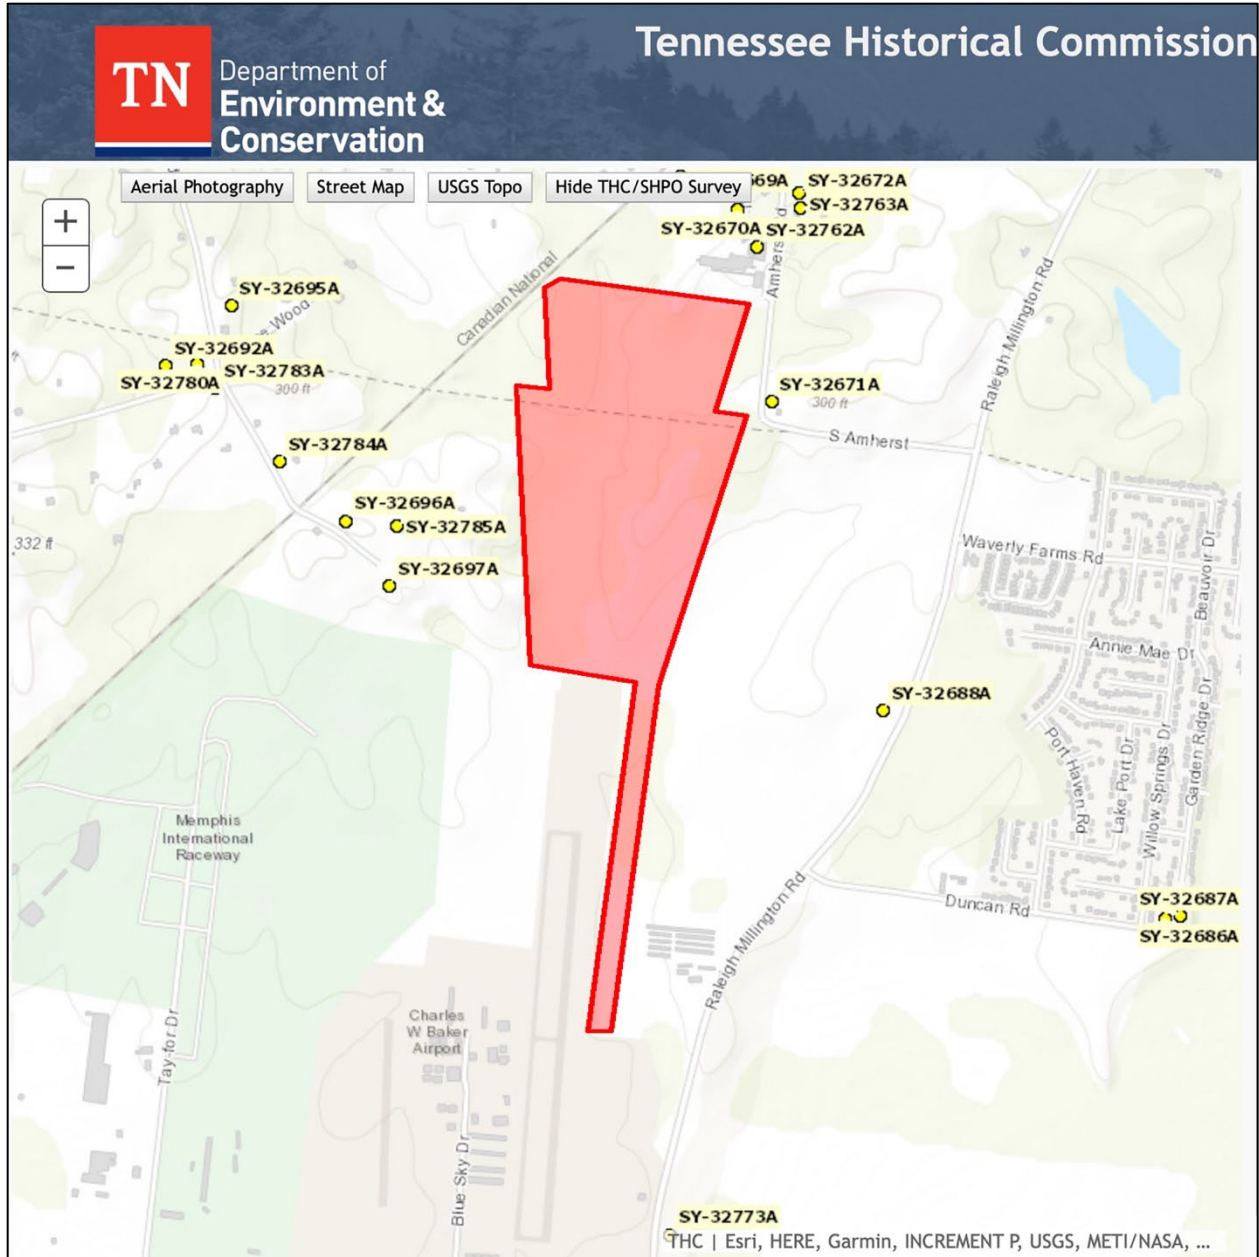

Figure 4-04. THC viewer showing previously recorded properties near the Baker Airport APE.

NRHP LISTINGS

There are 200 listed properties and districts in Shelby County, Tennessee, including four National Landmarks. Importantly, there are no NRHP listed properties within the proposed Baker Airport tree obstruction APE. The only listed property in Millington is the Barretville Bank and Trust Company Building at 9043 Barret Road, several km northeast of the APE. The nearest listed property to the APE is 6.5 km to the south: this is “Goodwinslow” at 4066 James Road in Raleigh.

CARTOGRAPHIC REVIEW

1888 W.T. WILLIAMSON MAP OF SHELBY COUNTY

The 1888 W.T. Williamson map of Shelby County is an important archival resource because it shows landowners and property boundaries with acreages. Examination of this map reveals that the APE lies within four parcels (Figure 4-05). The southern end is within W.J. Chase's 304 ac. tract. This interpreted as the William Joiner Chase that is buried in the Memphis Elmwood Cemetery (*Find-a-Grave* Memorial ID 23694230). Headstone inscription data reveal he was born June 2, 1845 and died August 23, 1907. Additional genealogical information regarding him, his spouse, siblings and children can be found in *Find-a-Grave*. W.J. Chase (age 35) is enumerated in the 1880 Census as living at 104 South Third Street in Memphis, and his occupation was grain merchant. Other members of the household included his wife (Martha age 27), two children and mother (Mary age 54). Given his address and occupation, Mr. Chase likely had tenants working the property at what is now the Baker Airport.

The west-central portion of the APE is within a 503 ac. tract owned by "Mrs. P.P. Ward (Dower)" (Figure 4-05). She also owned another 397 ac. tract to the southeast. Note that Dower is a reference to the part or interest in the real estate of a deceased spouse given by law to the surviving spouse during their life. Mrs. P.P. Ward is thought to be a descendant of Permelia P. Phipps Ward, who was born December 28, 1821 and died November 11, 1865, and is buried in the Lucy Cemetery to the north of the APE; see THC property SY-32692A in Figure 4-03 and Table 4-02 (Memorial ID 24087938). This cemetery is also known as the Ward Cemetery. P.P. Ward, a 58 year-old widow, is enumerated in the 1880 Census as living in District 3 Shelby County, Tennessee, which includes the 503 ac. parcel of interest (see Figure 4-03). Her occupation was listed as farming, so she likely lived somewhere within the 503 ac. parcel (or her 397 ac. property on the Raleigh Millington Road). Also living in her household during 1880 were her children: son Newton (age 36), daughter Lucy (age 24) and daughter Mary (age 12). Note that other Ward's—Lucy Ward and W.W. Ward owned adjacent tracts to the south in 1888 (see Figure 4-03). Lucy P. Ward (1858-1916) and William W. Ward (1882-1922) both buried at Elmwood Cemetery in Memphis.

The east-central portion of the APE is within Ila E. Douglass 262.40 ac. tract. This tract is bordered on the east by the Raleigh Millington Road. Ila E. Douglass is buried in the Elmwood Cemetery in Memphis, and his headstone inscription reveals that he was born ca. 1840 and died October 5, 1897. Genealogical information contained in *Find-a-Grave* (see Memorial ID 29290680) reveals that he married Sarah Ann Trigg Douglass (1847-1929) on December 2, 1868 in Memphis. Reportedly they had nine children of which five survived into adulthood. Additional genealogical information regarding two the children—Margaret Trigg Douglass (1872-1957) and Ennis McMillian Douglass (1874-1943)—can be found in *Find-a-Grave*. The mother and two children mentioned above are also buried at Memphis Elmwood Cemetery.

The ownership of the far northern end of the APE is unclear from review of the 1888 Williamson map. It may be part of the Mrs. P.P. Ward (Dower) 503 ac. parcel.

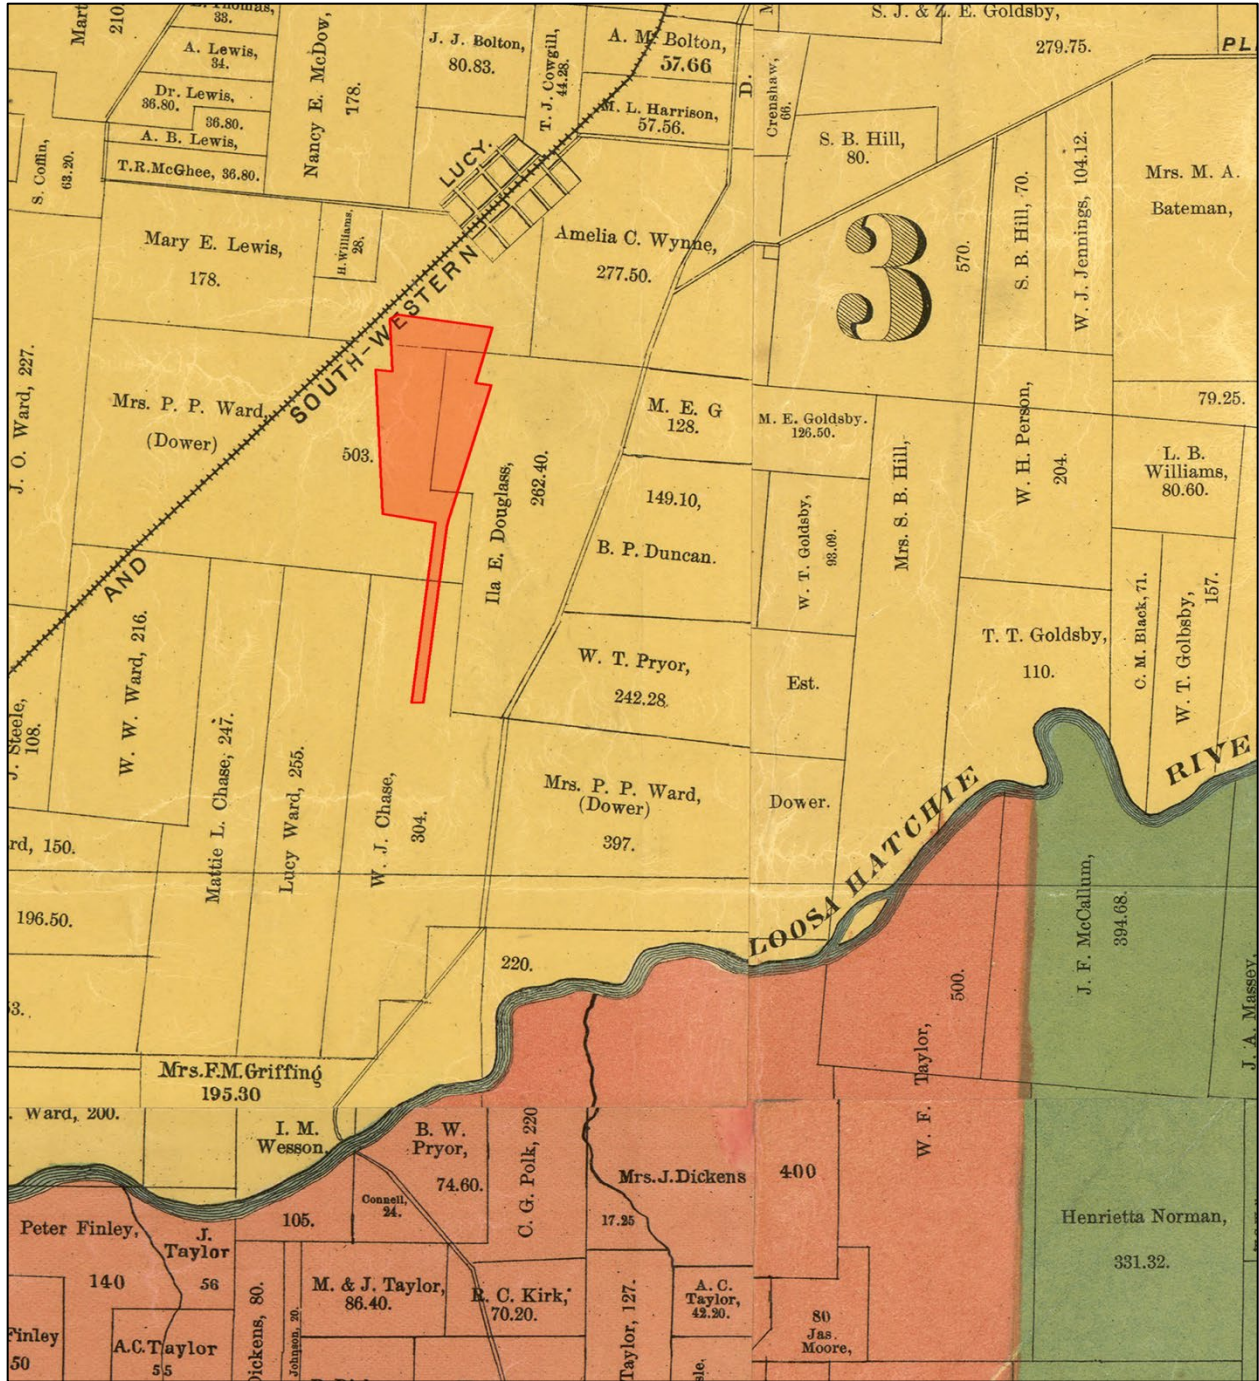

Figure 4-05. A portion of the 1888 Williamson Shelby County map with the APE indicated (map courtesy: Library of Congress).

1942 QUAD

The 1942 Millington, TN 15-min. quad reveals one structure within the narrow southern portion of the tree obstruction APE (Figure 4-07). The Charles W. Baker Airfield was constructed in 1942, see 40SY704 remarks above, however is not shown on this source. The APE is largely associated with a south-southeasterly trending unnamed drainage that leads a channelized reach of the Loosahatchie River. This reach of the Loosahatchie River r was channelized after 1939; because it is shown on the 1939 Tennessee State Highway Department “General Highway and Transportation Map, Shelby County, Tennessee” as sinuous.

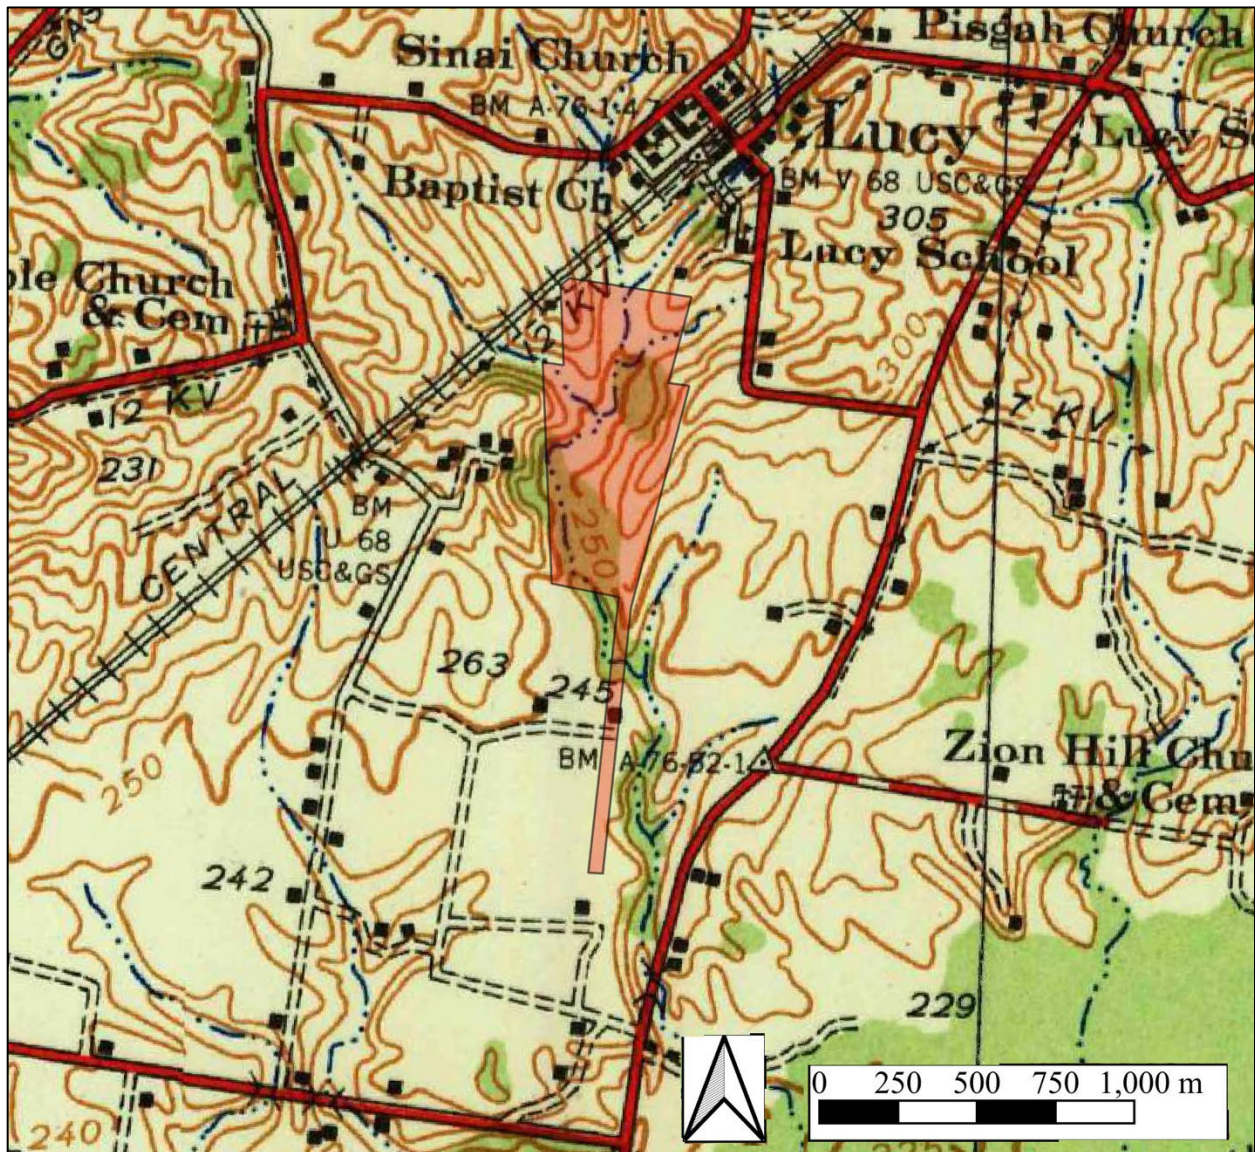

Figure 4-07. A portion of the 1942 Millington, Tennessee 15-min. quad with the APE shown.

1960 QUADRANGLE

The 1960 Millington, TN 15-min. quad shows the Charles W. Baker Airport as a Star of David shaped feature to the southwest of the tree obstruction APE that is labeled “Millington Municipal Air Park” (Figure 4-08). This star shaped feature is enclosed by the rectangular area indicated as the 40SY704 boundary on TDOA site form for the airfield. Importantly, the tree obstruction APE does not include any portion of the WW II feature, thus the APE is outside the limit of the WW II OLF. Similar to the 1942, edition the only feature shown within the APE in 1960 is an unnamed tributary of the Loosahatchie River.

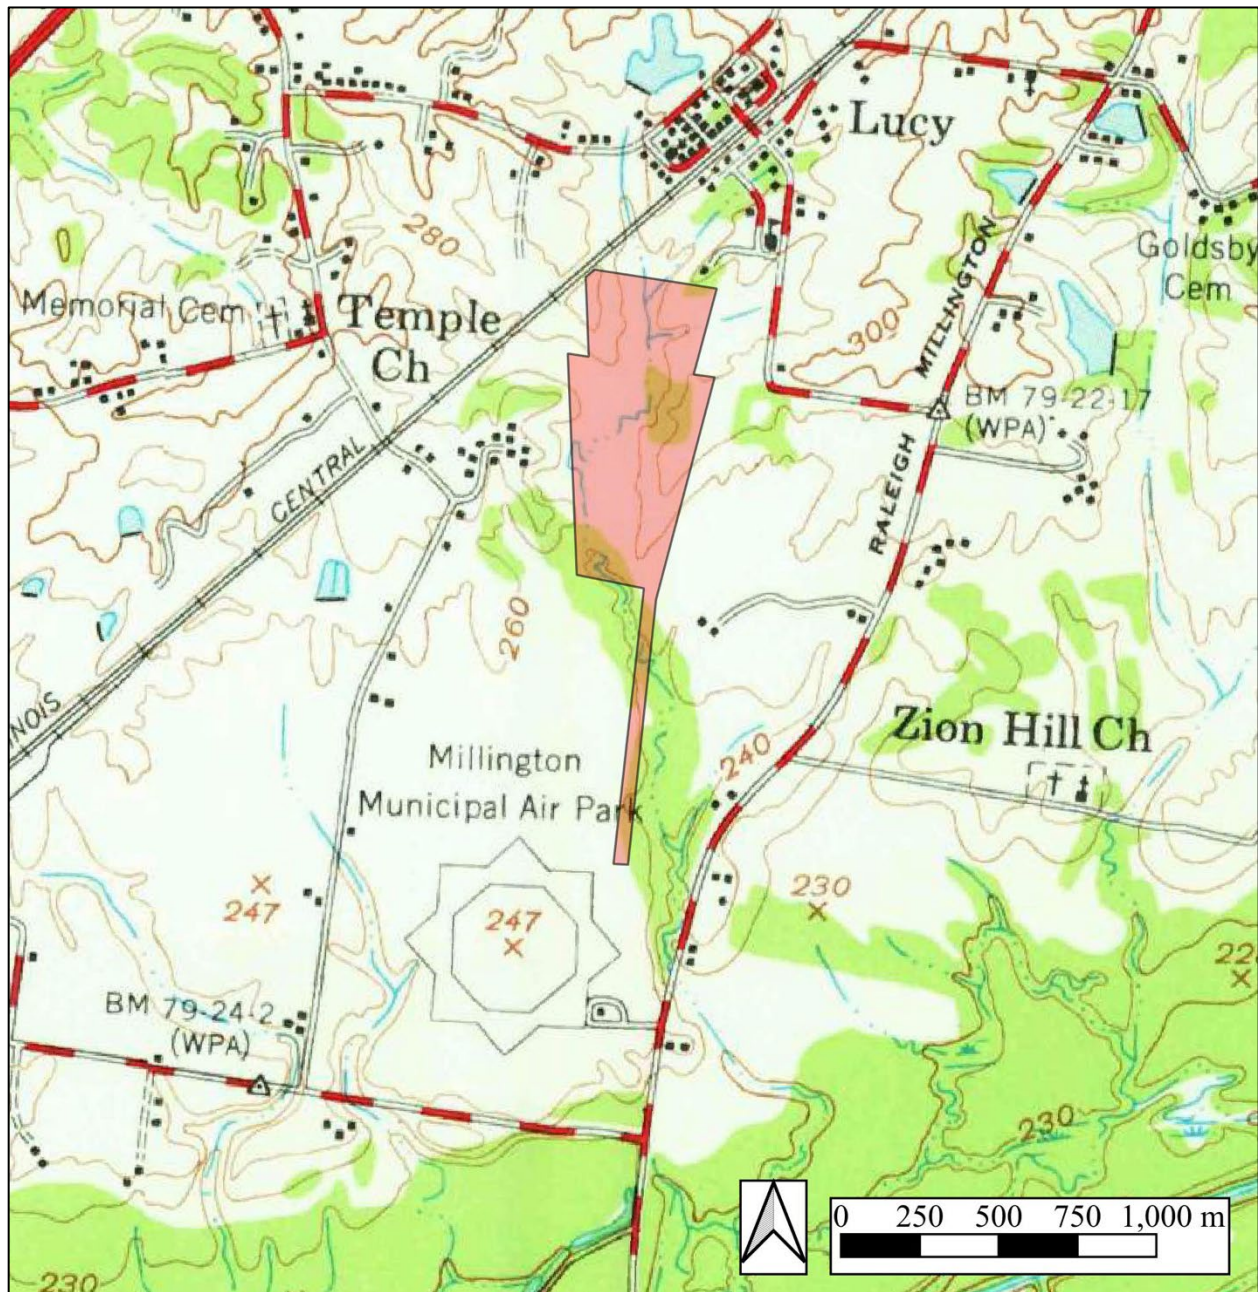

Figure 4-08. A portion of the 1960 Millington, TN 15-min. quad with the APE shown.

1971 QUADRANGLE

The 1971 Millington, TN 15-min. quad shows the Charles W. Baker Airport in its current configuration, although runway 18U/36U is not indicated (Figure 4-09). Similar to 1960 quad, the only feature shown in the tree obstruction APE is an unnamed tributary of the Loosahatchie River that is partly wooded.

Recall that the Star of David shaped WW II OLF here was released to civilian control in 1946, and the Charles W. Baker Airport opened in 1959. All but one of the eight original runways were demolished or heavily reconstructed during the ca. 1946-1959 conversion of the OLF to the Charles W. Baker Airport. The WW II runway that remains intact is located on the west side of the airfield complex and was formerly the ultra-light 18U/36U (see Figure 4-02). The primary asphalt runway 18/36 at the Charles W. Baker Airport is 3,500 ft. long by 75 ft. wide.

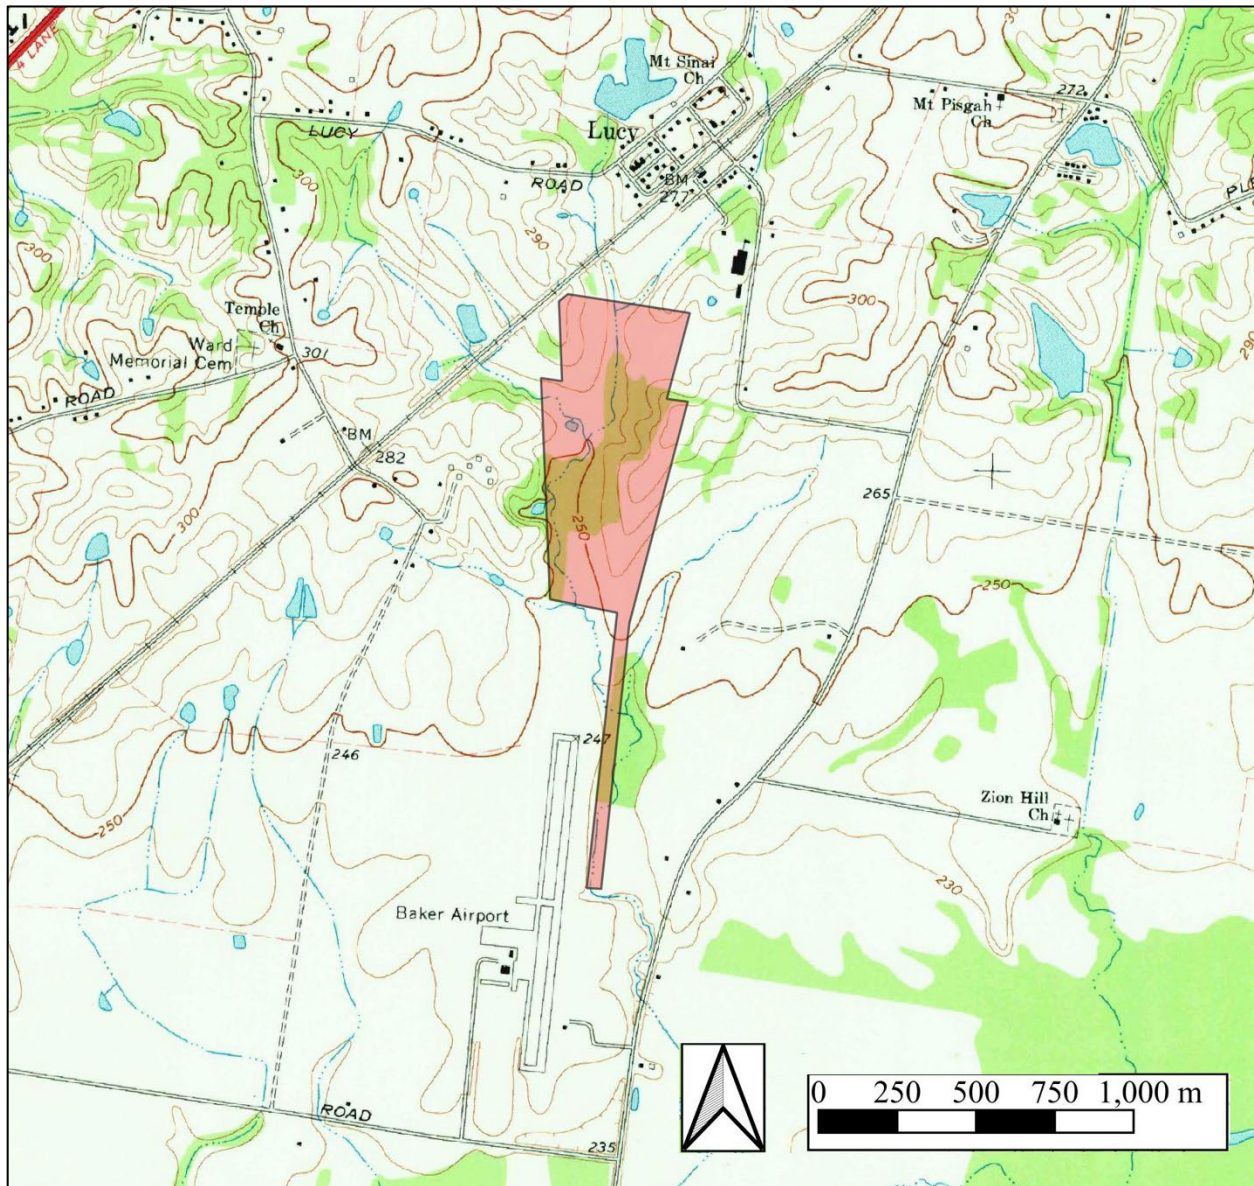

Figure 4-09. A portion of the 1971 Millington, TN 15-min. quad with the APE shown.

SURVEY EXPECTATIONS

Given the above, the following survey expectations can be offered. There are no known archaeological sites or historic properties within the tree obstruction property purchase APE. The review of various archival maps suggests there are two potential Historic domestic sites in the APE, one in the north-central section that is shown on a 1916 source and one to the south that is shown on a 1942 source. These occupations are interpreted as short term because neither structure is shown on later sources that were reviewed.

More generally, the environmental setting and soils across the majority of the APE leads us to conclude that, overall, the APE has a moderate to low probability of containing archaeological resources. Indeed, the western side of the APE is a delineated wetland (see Figure 1-03).

The expected archaeological site density for the APE can be inferred from Peterson's (1979a) sample survey of the Loosahatchie River Watershed. As previously noted, during this milestone investigation, the Loosahatchie River Watershed was stratified into three environmental zones (floodplain, terraces, and uplands), subdivided into 1-min. quadrants, and a three percent random sample of the quadrants was surveyed. Peterson's (1979a) results revealed that archaeological sites in the Loosahatchie River Watershed are concentrated on terraces, where 3.22 sites were identified per km². In contrast, uplands—such as the tree obstruction property purchase APE—yielded only 0.49 sites per km² and floodplains even less at only 0.22 sites per km². Since the 97.2 ac. (0.39 km²) APE is associated with uplands the number of expected sites is < 1 (i.e., 0.79 sites, or 0.39km²/0.49 sites per km²).

5. FIELD INVESTIGATIONS

METHODS

A four-person crew consisting of a Register of Professional Archaeologist (RPA) certified Archaeologist and three Archaeological Technicians conducted the fieldwork at the APE over four days between February 2 and 16, 2022 (see *Acknowledgements*). Much of the 97.2 ac. APE was subjected to shovel testing at 20 m intervals, but wetland areas, in particular in the northwestern section of the APE, were visually inspected.

OBJECTIVE

The two main objectives in conducting the intensive archaeological survey were as follows: (1) to obtain a complete inventory of all significant cultural resources present; and (2) to evaluate all identified resources relative to eligibility criteria of the NRHP (36 CFR 63). No data recovery beyond the constraints of an intensive (shovel test) survey and site boundary delineation was expected.

SHOVEL TEST DEFINITION

A shovel test consisted of the excavation of a four-sided hole at least 30 cm to a side (0.09 m²). Each shovel test was excavated to culturally sterile deposits. To ensure consistent artifact recovery, all sediment was hand-screened through 0.25-in. mesh hardware cloth. All natural and cultural strata revealed in the individual shovel test profiles were recorded using metric depth measurements, and described in terms of textural class and color (using the Munsell Soil Color Chart). Additional strata descriptions were provided as needed, such as moisture, natural rock content, and number and size of roots. Commonwealth employs a specialized shovel test form to insure consistent shovel test profile recording. Following recording a shovel test, artifact sample bags (if any) were labeled. All holes were subsequently backfilled as closely as possible to the original condition.

GPS DATA COLLECTION

During the survey the positions of all shovel tests were recorded using Global Positioning System (GPS) equipment. The Field Director used a Trimble Geo7X unit, capable of sub-meter accuracy to record the shovel test locations. The resulting metadata (i.e., shovel test UTM coordinates) was integrated into Geographic Information System (GIS) ArcMap format to produce a shovel test distribution map.

SURVEY DOCUMENTATION

To ensure appropriate field data management, Panamerican employs a system the company developed for intensive surveys. This system has been used successfully during various past projects within Tennessee. Throughout the course of the fieldwork, the crew used specialized forms to individually record the shovel test locations. The status of each shovel test was assessed as positive (■), negative (□), or not excavated (∅). In the case of the latter, which are referred to as “no-test” locations, the reason for not excavating a shovel test is provided on the forms. This allows for a complete inventory of shovel tests to be generated. Shovel test profiles, sediment characteristics, and depths of artifact recovery, if any, were recorded on the forms during the fieldwork. The shovel test data was later entered into a Microsoft Excel spreadsheet by laboratory staff and a table presenting the information was produced (*Appendix B*). Field documentation also included the following: (1) the Field Director maintained a set of field notes; (2) the survey area was recorded using photography; and (3) a number of logs or lists were maintained, including one for photos.

RESULTS

The archaeological survey of the APE resulted in the identification and documentation of two newly recorded archaeological sites (40SY925 and 40SY926) (Figure 5-01). There are no standing structures within the APE.

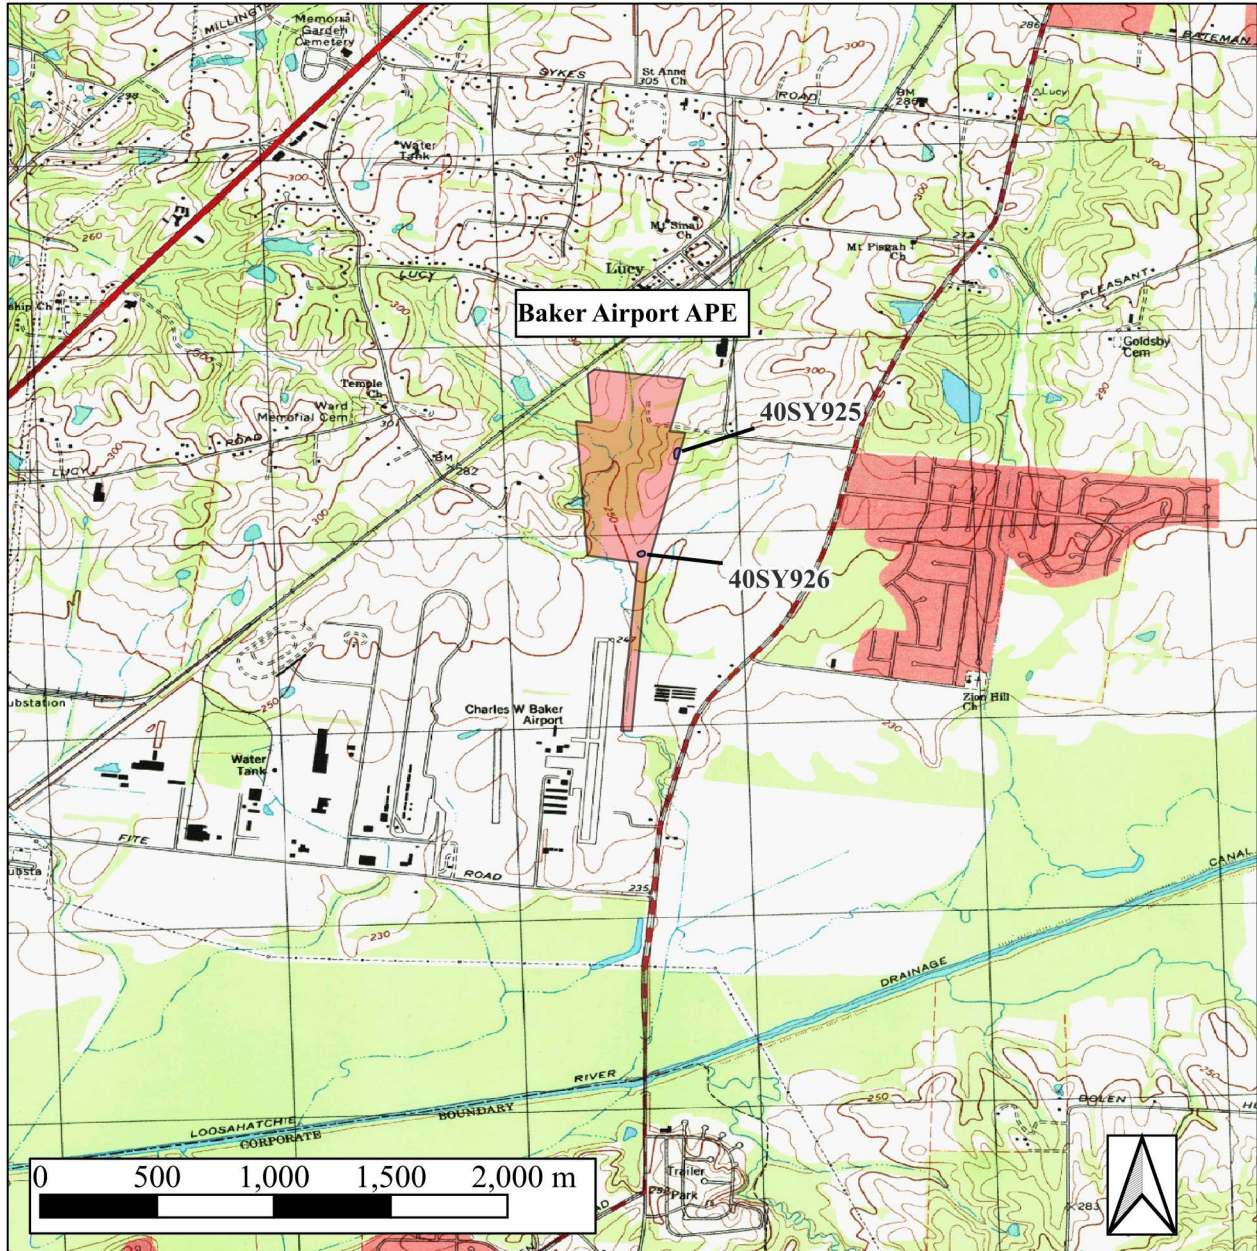

Figure 5-01. Archaeological site locations shown on the Millington, TN 7.5-min. quad.

During the course of the fieldwork a total of 498 shovel tests was recorded within the 97.2 ac. APE, including 442 that were negative for cultural material and 56 “no-test” location where a planned shovel test was not dug, mainly due to standing water (Figure 5-02; *Appendix A*). The shovel test depths ranged from 3 cm to 48 cm and averaged $32.17 \text{ cm} \pm 7.05 \text{ cm}$. Larger areas of wetlands, principally located in the central and western portions of the tract, were not shovel tested (see Figure 1-03), but they were visually inspected.

Figure 5-02. Shovel test distribution map produced using GPS data shown on a 2017 LiDAR image.
Tests outside the APE include some delineations at 40SY925 and two tests on transect 31 that went long.

Type Open Habitation; Farmstead
Size..... 1,400 m²
Artifact Recovery Total71
Recommended NRHP StatusNot eligible

Location and Setting

40SY925 is a newly recorded multi-component Prehistoric scatter and former Historic house site located in the northeast portion of the project area (see Figure 5-01). The site is about 150 m south of an access road to a utilities facility, and 730 m east of the intersection of Amherst Road and Raleigh-Millington Road. The setting is a ridge crest in loess uplands, and the elevation is about 290 ft. with the terrain sloping down to the east, south and west. An unnamed tributary of the Loosahatchie River is approximately 200 m west of 40SY925. The cover is a harvested field with good to excellent surface visibility (50 to 100 percent) (Figure 5-03).

Figure 5-03. 40SY925, view south (IMG_2203).

Archaeology

40SY925 was identified as a surface scatter during the transecting of the APE. Transects 5 and 6 traversed the site location, but there were no positive shovel tests (Figure 5-04). Delineation shovel tests were dug at 10 m intervals off the two of the transect shovel tests, but there were also negative for cultural material. To summarize, all shovel tests at 40SY925 were negative.

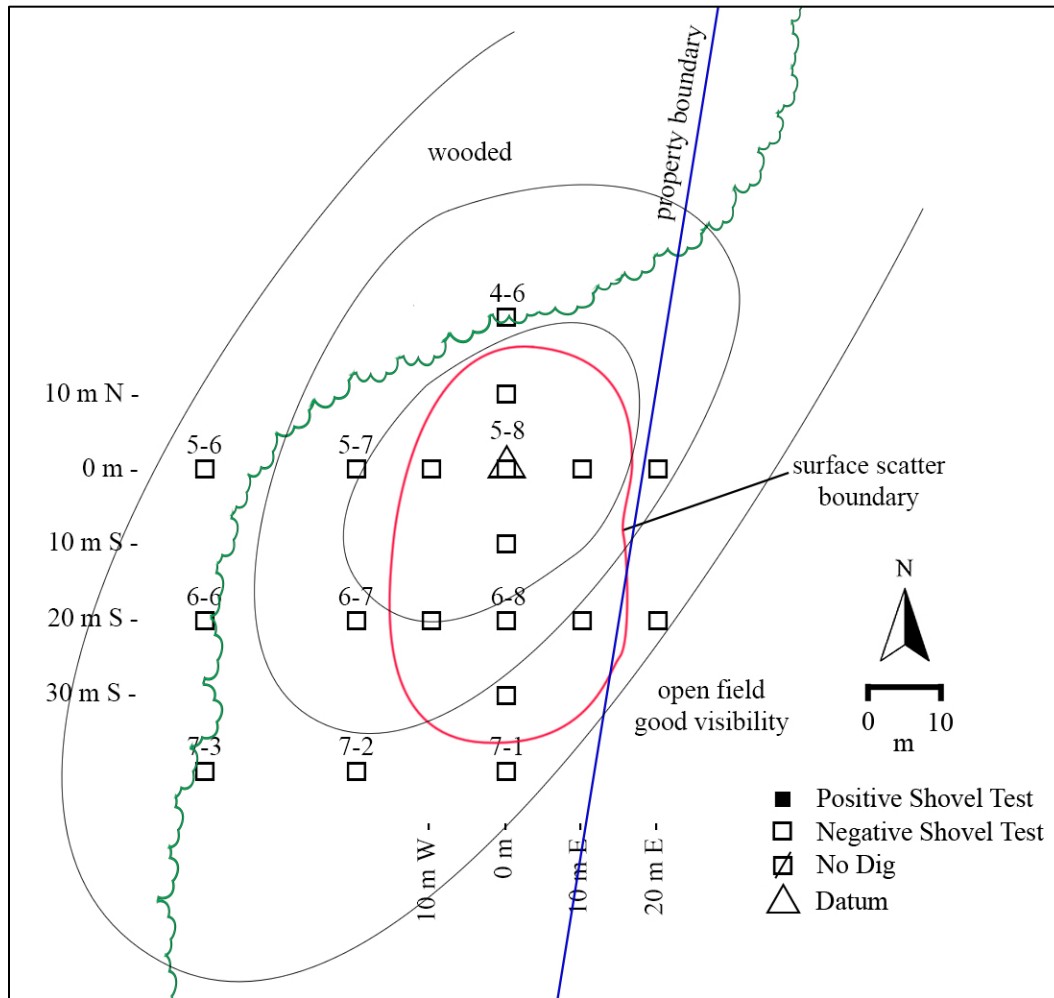

Figure 5-04. Sketch map of Site 40SY925.

A 100 percent surface collection was obtained from the site.

The setting is an eroded ridge crest that has been terraced in an effort to control erosion (see Figure 5-03). The site is mapped occurring on Memphis silt loam, 2 to 5 percent slopes, moderately eroded, northern phase (MeB2). A typical shovel test profile within the site was recorded as follows: plowzone from 0-17 cmbs, 10YR 5/6 + 6/4 silty clay; and subsoil 17-37 cmbs, 10YR 5/6 silty clay (Figure 5-05). The plowzone appears to be a cultivated portion of the upper subsoil.

40SY925 is interpreted as a deflated scatter that has been compromised by erosion of the original surface soil horizon.

Artifacts

The 40SY925 assemblage consists of 71 artifacts, including 60 Prehistoric and 11 Historic items (Table 5-01). All recovery was from the surface.

Key Prehistoric diagnostics include two Late Archaic/Early Woodland contracting stemmed projectile point/knives (PP/K) (see Figures 6-02a and b) and three Woodland Baytown Plain, *var. Madison* potsherds (sherds) (see Figure 6-02d1 and d2).

Figure 5-05. Typical shovel test profile at 40SY925 (IMG_3621).

Table 5-01. 40SY925 Artifact Recovery.

Transect	Shovel Test	Depth (cm)	Artifact Category	Comments	N	Mass (g)

The raw materials used in the two contracting stemmed points are extra-local cherts, and include Pickwick chert and an unidentified non-local black chert. Pickwick chert originates in the Ft. Payne formation in northern Alabama in the vicinity of the Pickwick Dam and Savannah, Tennessee, a distance of some 100 mi. from 40SY925 (Futato 1983:120). The use of extra-local raw materials among the Late Archaic/Early Woodland PP/Ks here implies that the groups occupying the site at that time were mobile and likely practiced a seasonal round settlement pattern with part of the year residing in west Tennessee near the Mississippi River and part of the year living to the east along the lower Tennessee River.

The remainder of the Prehistoric assemblage from 40SY925 consists of non-diagnostic lithic artifacts, including 11 retouched pieces (minimally utilized pieces of debitage), 38 pieces of debitage, two pieces of fire cracked rock and an unmodified pebble. With two exceptions, all of this non-diagnostic material is Citronelle cherty gravel, which is a locally available resource.

The three pottery sherds (sherds) from 40SY925 are typed as Baytown Plain, *var Madison* (Mainfort and Chapman 1994:160), which fall under what was previously classified as “Thomas” ware (Phillips et al. 1951:141-142; Smith 1979a, Smith and Weinstein 1987). Importantly, Mainfort and Chapman (1994:159) reject the temporal distinctions associated with Thomas ware, thus the FS-1 Baytown Plain, *var Madison* sherds are simply considered generalized Woodland diagnostics. Three residual sherds were also recovered that are too small and weathered to type.

The small Historic assemblage largely consists of Kitchen Group artifacts (8/11), but also contains two Architectural Group artifacts (two common brick fragments) and an unidentified ferrous object. This artifact pattern is typical for rural farmsteads in west Tennessee, although the overall artifact frequency is quite low; this likely related the degradation of the site by nearly a century of plowing and erosion.

The Kitchen Group artifacts include stoneware (n=4), plain porcelain (n=1) and aqua bottle glass fragments (n=3). The most diagnostic items in the Historic assemblage are the stoneware sherds, which are all salt-glazed and likely produced in the nineteenth century.

Additional Comments

40SY925 is located within Ila E. Douglass’s 262.40 ac. tract on an 1888 map (see Figure 4-05). Ila E. Douglass (1840-1897) is buried at Elwood Cemetery in Memphis, and it is unclear if he ever lived in this area (the community of Lucy; see Chapter 4).

A structure is shown near the 40SY925 location on the 1916 Shelby County Soil Map, and an east-west road is shown to the north of it (see Figure 4-06). By 1942 both the structure and the road are gone, and they do not re-appear on any later source that were examined.

Given the presence of salt-glazed stoneware and the 1916 map data, the 40SY925 Historic component is interpreted as a late nineteenth to early twentieth century occupation.

Recommendation

The recommended NRHP status for 40SY925 is not eligible. The site is a low-density scatter of Prehistoric and Historic material in a surface context with no subsurface recovery. The site location appears to badly eroded and deflated, thus destroying its integrity. Multi-component scatters similar to this are common in agricultural areas of west Tennessee, and this example does not meet enough of the criteria for farmstead eligibility established by Wilson (1990) to be considered eligible. Additional investigations at 40SY925 are unlikely to yield any additional significant archaeological data relevant to our understanding of either Late Archaic/Early Woodland to Woodland occupation and/or late nineteenth to early twentieth century farmsteads in west Tennessee. As such, the recommended management action is no further work.

40SY926

Cultural Affiliation.....	Late Woodland/Mississippian
Type	Lithic scatter/hunting camp
Size.....	900 m ²
Artifact Recovery Total	18
Recommended NRHP Status	Not eligible

Location and Setting

40SY926 is a newly recorded Prehistoric lithic scatter in the southeast portion of the project area and the site location can be identified on the Millington 7.5-min. quad (see Figure 5-01). The site is about 40 m north of the Charles Baker Airport fenceline and 730 m east of Raleigh-Millington Road. The setting is a finger ridge between two unnamed tributaries of the Loosahatchie River, with the elevation being about 250 ft. and the terrain dropping down to <250 ft. the east, south and west. The cover is cultivated field with excellent surface visibility (75-100 percent). (Figure 5-07).

Archaeology

40SY926 was identified as a low-density surface scatter during the transecting of the APE. Transects 26, 27 and 28 were run over the site location, but there were no positive shovel tests (Figure 5-06). Delineation shovel tests were dug at 10 m intervals off shovel test 27-3, which was in the center of the observed surface scatter, but these tests were also negative for cultural material.

A 100 percent surface collection was obtained.

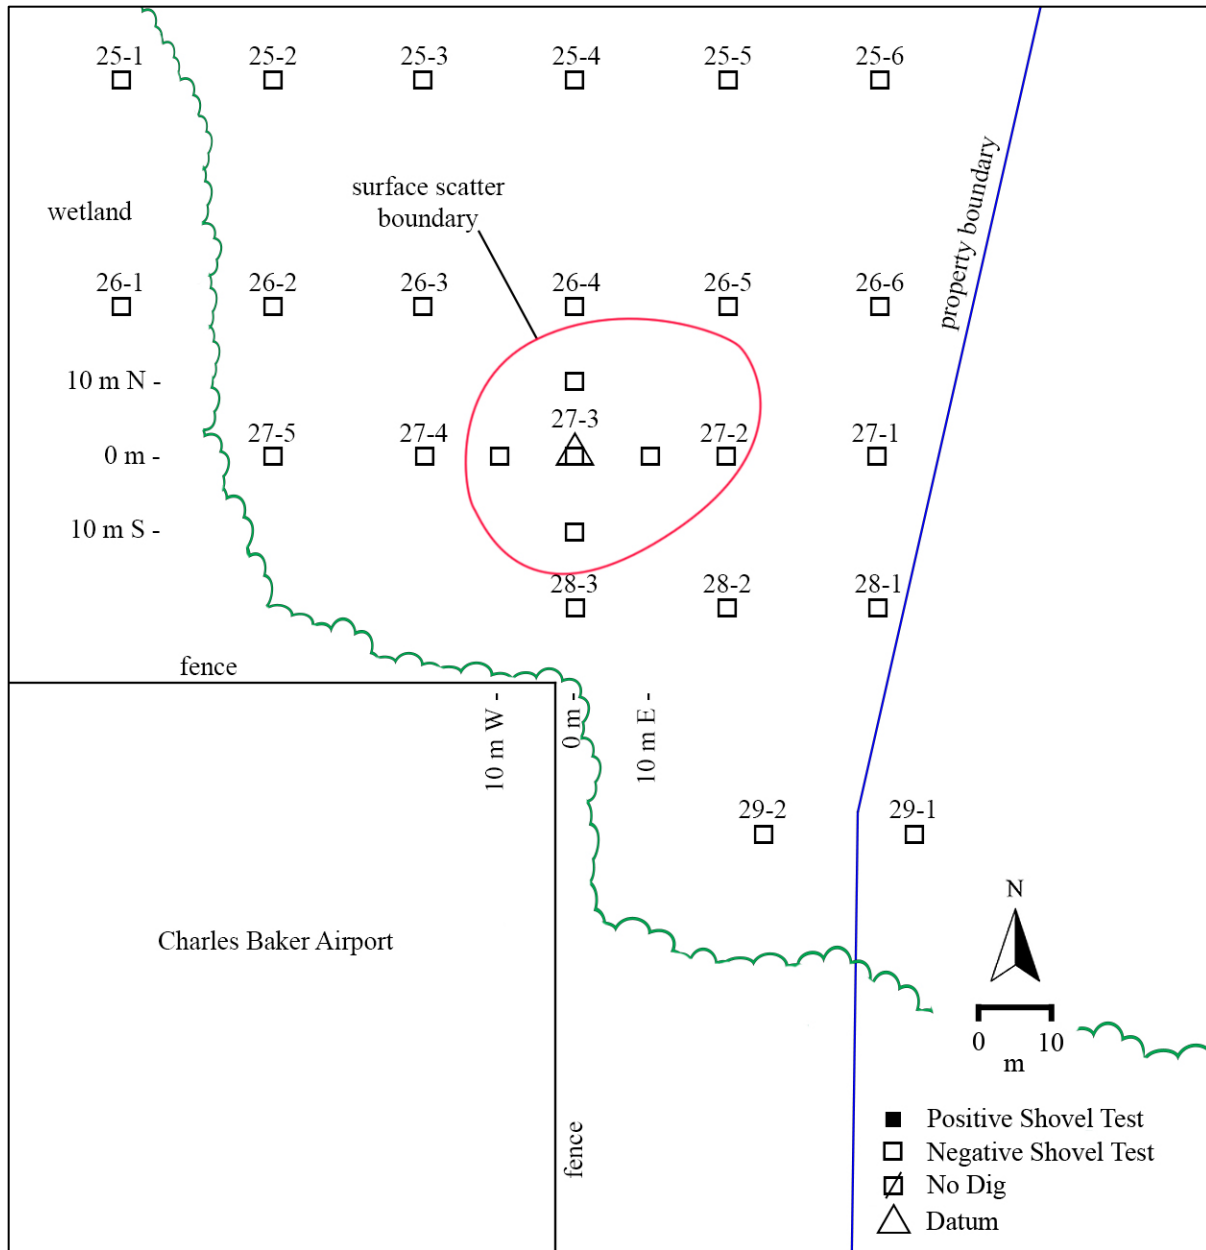

Figure 5-06. Sketch map of Site 40SY926.

40SY926 is mapped as Memphis silt loam, 2 to 5 percent slopes, moderately eroded, northern phase (MeB2). A typical shovel test profile within the site was: plowzone from 0-6 cmbs 10YR 6/4 silty clay; and subsoil from 6-26 cmbs, 10YR 6/6 clay (Figure 5-08). The plowzone appears to be a cultivated portion of the upper subsoil.

40SY926 is interpreted as a deflated scatter that has been compromised by the erosion of the original surface soil horizon.

Figure 5-07. Site 40SY926, view north (IMG_2180).

Figure 5-08. A typical shovel test profile at 40SY926 (IMG_2204).

Artifacts

The small 40SY926 assemblage consists entirely of Prehistoric lithic artifacts and all recovery was from the surface (Table 5-02). The recovery a Madison arrowpoint base (see Figure 6-02c) allows for the site to be assigned as a Late Woodland/Mississippian component. The other artifacts from the site, including a biface fragment and a cobble core (see Figure 6-02e), are all non-diagnostic. The only raw material represented in the assemblage is Citronelle cherty gravel, which is a locally available resource.

Table 5-02. 40SY926 Artifact Recovery.

		general surface collection	flake fragment		3	2.8
				Totals:	18	86.1

Additional Remarks

40SY926 is interpreted as a briefly occupied hunting camp or chipping station.

Recommendation

The recommended NRHP status for 40SY926 is not eligible. Small, low-density lithic scatters are common within loess region of west Tennessee, and this example is too deflated and lacking in subsurface integrity to warrant additional investigation. Beyond the component and location data that are already in hand, the site is incapable of yielding any additional significant archaeological information. As such, the recommended management action is no further work.

NEGATIVE FINDINGS

Transects were run west from the eastern boundary to an area of wetlands that extended to the western boundary. The eastern side of the project area was in a cultivated field that was harvested and had good surface visibility (Figure 5-09). This field has been terraced in an attempt to control erosion.

The wooded area west of the field was in young hardwoods (Figures 5-10 and 5-11). The wetlands area was covered in standing water and there were signs of beaver activity (Figures 5-12 and 5-13).

The northern third of the project area was mostly low-lying land that showed signs of water running through the tract (Figure 5-14). The eastern and western boundaries of this northern portion were on higher ground and in young woods (Figure 5-15). Transects were run east and west from a utility access road across this area.

There was a narrow strip located along the eastern boundary of the airport and forming the southern end of the project area. This strip was very short grasses at the time of investigation and had poor surface visibility (Figure 5-16). One transect was run to the north. A typical shovel test profile for this southern area was described as: plowzone from 0-22 cmbs 10YR 5/4 and 7/2 silty clay; and subsoil from 22-38 cmbs 10YR 5/2 and 5/4 silty clay (Figure 5-17).

ANCILLARY FINDINGS

Outside of the APE, some WW II era surface features associated with 40SY704 within the Charles W. Baker Airport were briefly examined. The now abandoned ultra-light runway 18U/36U appears to be a repaved portion of the western north-south WW II runway (see Figure 4-02). Adjacent to the east side of runway 18U/36U there is a strip of aging asphalt pavement with visible stream gravel aggregate that appears to be part of the original WW II pavement (Figure 4-18). The aging asphalt pavement strip is partly covered in grass and extends north to the end of runway 18U/36U.

We observed a southwest-northeast segment of another WW II runway, to the west of runway 18U/36U that leads southwest toward the Memphis Motor Sports Park, that had been paved over in the modern era.

While looking for additional WW II era features, we encountered Ron Spence, a local aviator. He curates an undated air photo of the 40SY704 WW II airfield as it was originally configured (see Figure 4-03).

Figure 5-18. Baker Airport abandoned ultra-light runway 18U/36U (left) and WWII era pavement (right), view north (P2142604).

6. ARTIFACT ANALYSIS

All artifacts recovered during the survey were transported to Commonwealth's laboratory in Memphis for processing and analysis under the supervision of Laboratory Director Arabela Baer, RPA. Analysis proceeded by provenience (unit, level, feature, etc.). Standardized analysis forms and artifact categories were used, and the data were keyed into a spreadsheet-type artifact inventory using Excel. All of the artifacts have been cataloged using a system compatible with the requirements of 36 CFR 79.

The recovered assemblage consists of 89 artifacts from two sites (Table 6-01). The majority of the recovery is Prehistoric lithic artifacts, but six ceramic artifacts were also recovered. The Historic assemblage is derived exclusively from 40SY925.

LITHIC SORTING METHODS

The chipped-stone analysis is based on the sorting scheme of Sullivan and Rozen (1985) and Rozen and Sullivan (1989a, 1989b) (Figure 6-01). The Sullivan and Rozen (1985) sorting method offers greater replicability over traditional stage typologies and was formulated specifically for the constraints (time and money) of contract archaeology. Additional commentary regarding the value of interpretative results derived from this scheme has been presented (Amick and Mauldin 1989; Ensor and Roemer 1989; Rozen and Sullivan 1989a, 1989b). While originally based on Arizona CRM samples, the descriptive merits of the system have proven to have general utility for characterizing and comparing lithic site assemblages in the Midsouth.

All lithic items were organized into two initial sorting categories according to the presence or absence of positive percussion features. Chipped-stone artifacts without positive percussion features were considered under the broad term “cores,” while chipped-stone artifacts with positive percussion features were considered debitage. All cores, or items that exhibited flake scars, were then subdivided into more traditional subcategories: PP/Ks, bifaces, and other (traditional) cores. The presence or absence of retouch initially subdivided the remaining debitage. Like cores, retouched debitage may be further subdivided into more traditionally assumed functional or morphological categories. The identification and classification of retouched pieces can be problematic, given the gradation from formal to expedient “use-wear” type retouch. In general, the Sullivan and Rozen (1985) typology initially defines three chipped-stone tool categories: cores, retouched pieces, and debitage.

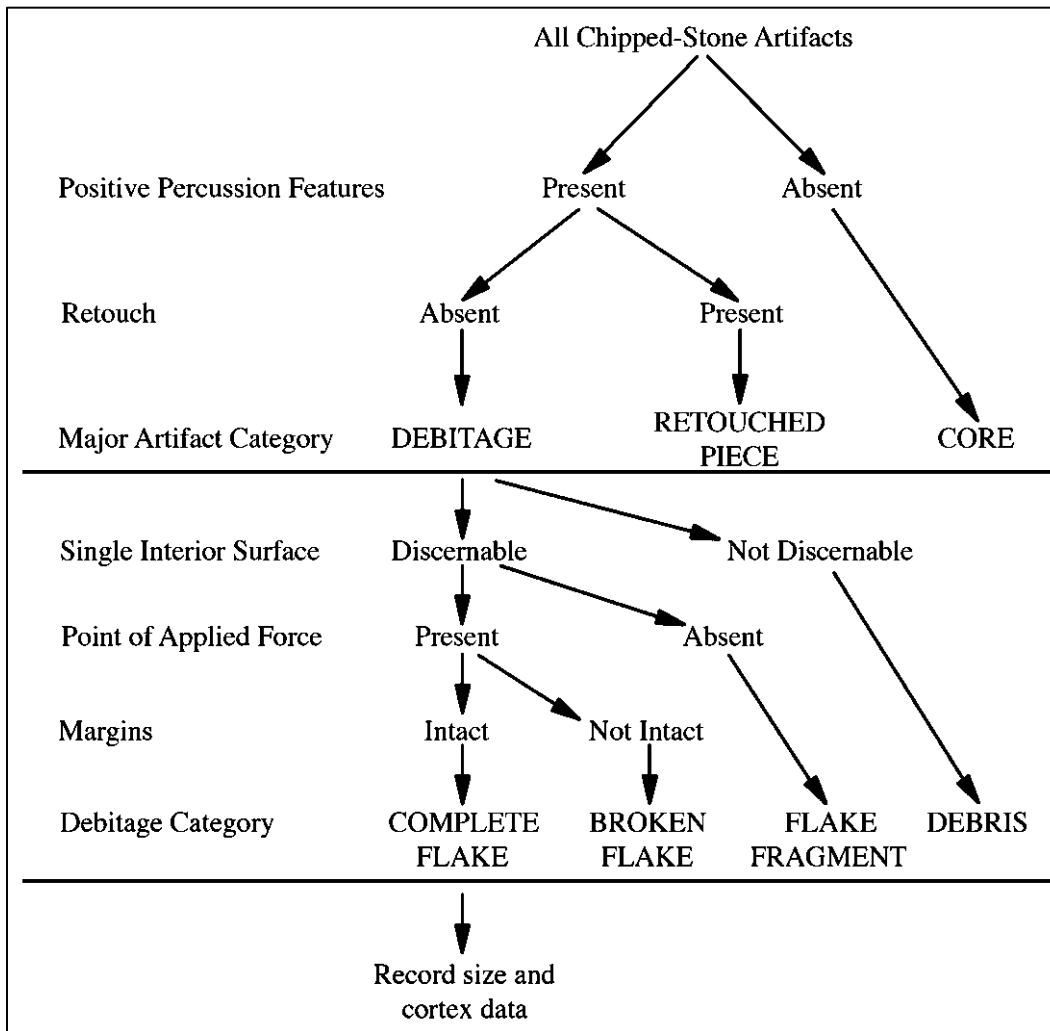

Figure 6-01. Technological attribute key used to identify major chipped-stone and debitage categories (after Sullivan and Rozen 1985).

The classification of debitage is where the scheme varies the most from traditional approaches. Pieces without observable interior faces were considered “debris,” which is similar to “chipping shatter” of traditional approaches. Pieces of debitage with observable interior faces but lacking bulbs of percussion were considered “flake fragments.” Fragments with both observable interior faces and bulbs of percussion were considered either “complete flakes” if the margins were intact

or “broken flakes” if the lateral margins were not intact. Complete flakes are typically subjected to further analysis.

All complete flakes were size sorted into one of three size grades:

- Size grade 1 = 0.25–0.50 in.
- Size grade 2 = 0.50–1.00 in.
- Size grade 3 = >1.00 in.

Cortex grading is designed to assess the percent of cortex that remains on the dorsal surface of a complete flake. All complete flakes were size sorted into one of four cortex grades:

- Cortex grade 1 = no cortex present.
- Cortex grade 2 = 1–33 percent cortex.
- Cortex grade 3 = 34–66 percent cortex.
- Cortex grade 4 = 67–100 percent cortex.

LITHIC ANALYSIS RESULTS

Prehistoric lithic artifacts represent the majority of the project recovery (80.8 percent, or 72/89). Importantly among the lithic artifacts, there are three projectile point/knife (PP/K) fragments that are diagnostic. The remainder of the project’s lithic assemblage consists of non-diagnostic items: a core, retouched pieces (i.e., informal utilized debitage), debitage, fire cracked rock and a pebble.

PROJECTILE POINT/KNIFES

Two medium-sized contracting stemmed projectile point/knives (PP/K) were recovered; both are from 40SY925. They both appear to fall within Justice’s (1987:189) Dickson Cluster and are considered Gary Contracting Stemmed examples. These points are diagnostic for Late Archaic to Early/Middle Woodland occupations.

One partial contracting stemmed specimen is knapped from an exotic reddish oolitic chert (Figure 6-02a). This raw material is interpreted as Pickwick chert, which originates in the Ft. Payne formation in northern Alabama in the vicinity of the Pickwick Dam and Savannah, Tennessee, a distance of some 100 mi. from 40SY925 (Futato 1983:120). This PP/K is broken mid-blade along a partial light gray and black arced area within the chert node and may represent a piece of “Pickwick Tricolor” chert. This specimen’s metric attributes are as follows: stem length 11 mm; stem width 17 mm, shoulder width 27 mm; and thickness 9 mm.

The second contracting stemmed specimen is knapped on a dull black chert, the source of which is not certain but is clearly a non-local exotic raw material. It has been heavily re-sharped, and was likely used as a hafted scraper (Figure 6-02b). The metric attributes for the Figure 6-02b specimen are as follows: length 35 mm; shoulder width 30 mm; stem length 14 mm; stem width at neck 17.5 mm; stem width at base 15 mm; and thickness 5 mm.

The PP/K from 40SY926 is the base of a Madison triangular point (Figure 6-02c). Madison points are arrow points and are considered diagnostic for Late Woodland and Mississippian components across a large section of the Southeastern U.S. (Justice 1987:224). This specimen is knapped on a typical light tan-colored Citronelle cherty gravel, which is a locally available raw material. Its metric attributes are base width 15 mm and thickness 5 mm.

Figure 6-02. Artifact plate: a-contracting stem PP/K base (40SY925 surface); b-contracting stem PP/K base (40SY925 surface); c-Madison triangular base (40SY926 surface); d1 and d2-Baytown Plain, *var. Madison* sherds (40SY925 surface); and e-cobble core (40SY926 surface).

BIFACE FRAGMENT

One biface fragment was recovered from 40SY926. It is 31 mm wide by 12 mm thick and appears to be one end of a preform. A small area of cortex remains. It is knapped from a tan Citronelle cherty gravel cobble, a resource that is locally available.

CORE

One cobble core was recovered from 40SY926 (Figure 6-01e). Multiple flakes have been removed from it, primarily from the side exposed in Figure 6-01e, but about 40 percent of the cobble retains water-worn smoothed cortex surface. Its metric attributes are as follows: size 45-x-33 mm with a thickness of 24 mm. It is knapped from a tan Citronelle cherty gravel cobble, a resource that is locally available.

RETOUCHED PIECES

Fourteen retouched pieces were recovered, including specimens from both sites (see Table 6-01). These examples are minimally retouched and represent lightly utilized pieces of debitage, and are considered expedient tools. All are knapped from Citronelle cherty gravel.

DEBITAGE

Most of the project's lithic assemblage consists of debitage, and as is typical of the region, debitage forms the bulk of the project's lithic assemblage (69.4 percent, or 50/72). The 21 complete flakes were subjected to size and cortex grade analysis, and the results reveal that most are medium sized (n=14) and have some cortex (only seven specimens are non-cortical). This is interpreted as the result of the reduction of the locally available Citronelle cherty gravels on-site, as all but one piece of debitage is composed of Citronelle cherty gravel.

FIRE CRACKED ROCK

Fire-cracked rock (FCR) is defined as any type of non-chipped-stone that has been fractured from exposure to heat. FCR is non-diagnostic. FCR is poorly represented in the project assemblage, and both pieces are from 40SY925.

PEBBLE

One unmodified pebble was recovered from 40SY925. It is a white stream rolled piece of chert about 10 mm in diameter.

PREHISTORIC CERAMICS

The three pottery sherds from 40SY925 are clay-tempered plain with a slightly sandy texture and range from 6 to 7 mm in thickness. The clay particles resemble grog (crushed sherds) and are blocky, and are clearly visible to the naked eye (Figure 6-02d1 and d2). These specimens are considered Baytown Plain, *var Madison* (Mainfort and Chapman 1994:160). Madison series ceramics are:

... characterized by the presence of baked particles in the paste, but varying amounts of sand are also present, resulting in soft, slightly raspy textured, often contorted to occasionally laminated paste that closely resembles the Forker Deer series [Mainfort and Chapman 1994:158-159].

Mainfort and Chapman (1994:159) note that Madison series ceramics fall under what was previously classified as "Thomas" ware (Phillips et al. 1951:141-142; Smith 1979a, Smith and Weinstein 1987). Importantly, Mainfort and Chapman (1994:159) reject the temporal distinctions associated with Thomas ware; thus, the 40SY925 Baytown Plain, *var Madison* sherds are simply considered generalized Woodland diagnostics.

The three residual ceramics from 40SY925 are pottery specimens that are too small and weathered to type.

HISTORIC ANALYSIS

Historic artifact groups were formulated and presented following the functional group classification system originally developed by Stanley South (1977). Artifacts were analyzed within a general type-ware-materials-class-group system, with the most detailed analysis performed at the type level and the most generalized analysis at the group level. Each artifact was analyzed largely upon the differences in formal characteristics based on South's system. Two functional groups are recognized in the recovered assemblage: Kitchen and Architecture. Artifacts that could not be placed into a functional group are considered miscellaneous items.

KITCHEN GROUP

The bulk of the Historic assemblage consists of Kitchen Group artifacts. Kitchen Group items are those associated with food preparation and consumption and are typically suggestive of domestic occupations. The classes within the Kitchen Group include ceramics (n=5) and bottle glass (n=3).

Ceramics

Four stoneware sherds were recovered (see Table 6-01). Stoneware was generally made for utilitarian purposes and was manufactured locally throughout the U.S. An attempt was made to identify the glazes, according to Greer (1981), and all four specimens are salt glazed. This was the most commonly used utilitarian stoneware glaze throughout the nineteenth century (Greer 1981:180). Salt-glazed vessels are manufactured using a different process for most other glazes: the vapor method. Common salt (sodium chloride [NaCl]) is thrown or dropped into the hot kiln, where it immediately vaporizes and adheres to the surfaces that are approaching vitrification. Salt-glazed vessels exhibit a characteristic “orange peel” texture, and the glaze is most often transparent (Greer 1981:181). Surfaces are often very glossy as well.

One piece of plain white porcelain was recovered. Porcelain is characterized by a completely vitrified, glass-like paste. In its original Chinese expression, it was made up of kaolin and feldspar that was fired at temperatures between 1,250–1,400° C, and the resulting “hard paste” displayed no difference between the body and the glaze (Stelle 2006). In contrast, English porcelain has a somewhat softer, slightly translucent paste and a clear, semi-gloss glaze that frequently appears distinct from the body (Curtis 1988; Cushion and Cushion 1992).

Bottle Glass

Bottle glass color offers some chronological data; thus, all bottle glass was sorted by color. All three specimens are aqua-colored and are fragments of mass-produced machine-made bottles. Aqua glass had a “general and very versatile application” and has been used since the introduction of glass bottles (Fike 1987).

ARCHITECTURE GROUP

The Architecture Group is represented by two brick fragments. Both are reddish colored and appear to be from common bricks (Gurcke 1987).

MISCELLANEOUS ITEMS

Miscellaneous items include one flat, rusted ferrous scrap that is roughly 1.5 cm square.

CURATION

The artifact assemblage and project records are temporarily stored at Commonwealth’s lab in Memphis and will be permanently curated with the Troy University Archaeological Research Center in Alabama.

7. SUMMARY & RECOMMENDATIONS

SUMMARY

At the request of AKRF, Inc., Commonwealth Heritage Group, Inc. (Commonwealth) conducted a Phase I cultural resources survey for the Charles Baker Airport property purchases. The purpose of the survey was to identify any cultural resource that is listed on, eligible for, or potentially significant for the National Register of Historic Places (NRHP) present within the APE and to provide appropriate management recommendations for any such cultural resource(s) identified. To that effect, a standard site files search was conducted by the Tennessee Division of Archaeology (TDOA) personnel for this project on November 18, 2022, and fieldwork for the assessment was conducted over four days between February 2 and 16, 2022, under the direction of Commonwealth Field Director, Andrew Saatkamp, RPA, with a crew of three Archaeological Technicians (Alex Derrera, Jacob Mabray and Alysia Shear). Fieldwork completed during this assessment adhered to the TDOT *Scope of Work for Consultant Implemented Phase I Archaeological Assessments* May 2021.

The Memphis-Shelby County Airport Authority proposes to purchase 97.2 ac. (39.3 ha) along and north of runway 36/18 at the Charles Baker Airport as a part of a tree obstruction removal project (see Figures 1-01 and 1-02). The entire 97.2 ac. (0.1519 mi.²) purchase area is considered the area of potential effect (APE). The terrain within the APE includes nearly level and undulating to rolling uplands, with elevations ranging from less than 250 ft. near the runway to over 290 ft. in the north. The APE is drained by an unnamed tributary of the Loosahatchie River and includes an extensive area of wetlands along this stream (see Figure 1-03).

A standard cultural resources site files search reveals that there are no previously recorded archaeological sites or historic properties located within the APE. Note, however, that a portion of the Baker Airport to the south of the APE is recorded as archaeological site 40SY704, a WW II airfield, based on archival research. Within a 2 km radius of the APE, there are eight previously recorded archaeological sites (see Figure 4-01; Table 4-01). Based on the results of the literature search (see “Survey Expectations” in Chapter 4), the environmental setting and soils across the majority of the APE lead us to conclude that, overall, the APE has a moderate to low probability of containing archaeological resources. The expected archaeological site density for the APE was inferred from Peterson’s (1979a) sample survey of the Loosahatchie River Watershed and because the 97.2 ac. (0.39 km²) APE is associated with upland terrain; the number of expected sites was < 1 (i.e., 0.79 sites, or 0.39km²/0.49 sites per km²).

The fieldwork for the assessment was conducted over four days between February 2 and 16, 2022. The site detection method relied primarily on the excavation of shovel tests at 20 m intervals and visual inspection. During the fieldwork, a total of 498 shovel tests was recorded within the 97.2 ac. APE, including 442 that were negative for cultural material and 56 “no-test” locations where a planned shovel test was not dug, mainly due to standing water (Figure 5-02; *Appendix A*). The shovel test depths ranged from 3 cm to 48 cm and averaged 32.17 cm ± 7.05 cm. Larger areas of wetlands, principally located in the central and western portions of the tract, were not shovel tested (see Figure 1-03), but they were visually inspected.

The survey of the Baker Airport APE resulted in the identification of two newly recorded archaeological sites (Table 7-01); there are no standing structures. Both are deflated, low-density surface scatters with no subsurface integrity, and 100 percent surface collections were obtained from each. 40SY925 is multi-component, and the use of extra-local raw materials among the two Late Archaic/Early Woodland PP/Ks from here implies that the groups occupying the site at that time were mobile and likely practiced a seasonal round settlement pattern with part of the year residing in west Tennessee near the Mississippi River and part of the year living to the east along

the lower Tennessee River. Later 40SY925 was occupied by a more sedentary Woodland group that used ceramics, and then during the late nineteenth and early twentieth century, it was a farmstead. 40SY926 is interpreted as a briefly occupied Late Woodland/Mississippian hunting camp or chipping station.

Table 7-01. Summary of identified cultural resources in the APE.

Site	Size (m2)	Artifact Recovery	Positive shovel tests	Component
40SY925	1,400	71	0	Late Archaic/Early Woodland; Woodland; late 19th and early 20th Century Historic
40SY926	900	18	0	Late Woodland/Mississippian

RECOMMENDATIONS

The recommended NRHP status for 40SY925 is not eligible. This site is a low-density scatter of Prehistoric and Historic material in a surface context with no subsurface recovery. The site location appears to be badly eroded and deflated, thus destroying its integrity. Multi-component scatters similar to this are common in agricultural areas of west Tennessee, and this example does not meet enough of the criteria for farmstead eligibility established by Wilson (1990) to be considered eligible. Additional investigations at 40SY925 are unlikely to yield any additional significant archaeological data relevant to our understanding of either Late Archaic/Early Woodland to Woodland occupation(s) and/or late nineteenth to early twentieth century farmsteads in west Tennessee. As such, the recommended management action is no further work.

The recommended NRHP status for 40SY926 is not eligible. Small, low-density lithic scatters are common within the loess region of West Tennessee, and this example is too deflated and lacking in subsurface integrity to warrant additional investigation. Beyond the component and location data that are already in hand, 40SY926 is incapable of yielding any additional significant archaeological information. As such, the recommended management action is no further work.

As there is no NRHP listed, eligible, or potentially significant cultural resource within the APE, no further work is recommended.

APPENDIX H

NOISE METRICS AND DATA

Appendix H Noise Metrics and Construction Noise Data

H.1 Introduction

Noise is a very complex physical quantity. The properties, measurement, and presentation of noise involve specialized terminology that is often difficult to understand. To assist reviewers in interpreting the complex noise metrics used in evaluating airport noise, this appendix introduces six acoustical descriptors of noise, roughly in increasing degree of complexity:

- Decibel, dB
- A-Weighted Decibel, dBA
- Maximum A-Weighted Sound Level, L_{max}
- Sound Exposure Level, SEL
- Equivalent A-Weighted Sound Level, L_{eq}
- Day-Night Average Sound Level, DNL

These noise metrics form the basis for the majority of noise analyses conducted at U.S. airports.

H.2 Decibel, dB

All sounds come from a sound source -- a musical instrument, a voice speaking, an airplane passing overhead. It takes energy to produce sound. The sound energy produced by any sound source is transmitted through the air in sound waves -- tiny, quick oscillations of pressure just above and just below atmospheric pressure. The ear detects these oscillating pressures interpreting it as "sound."

Our ears are sensitive to a wide range of sound pressures. Although the loudest sounds that we hear without pain have about one million times more energy than the quietest sounds we hear, our ears are incapable of detecting small differences in these pressures. Thus, to better match how we hear this sound energy, we compress the total range of sound pressures to a more meaningful range by introducing the concept of sound pressure level.

Sound pressure level (SPL) is measured in decibels (dB). Decibels are logarithms of a ratio, the numerator being the pressure of the sound source of interest, and the denominator being the reference pressure (equivalent to the quietest sound that an average healthy young adult can hear):

$$\text{Sound Pressure Level (SPL)} = 20 * \text{Log} \left(\frac{P_{\text{source}}}{P_{\text{reference}}} \right) \text{dB}$$

The logarithmic conversion of sound pressure to sound pressure level means that the quietest sound that we can hear (the reference pressure) has a sound pressure level of about 0 dB, while the loudest sounds that we hear without pain have sound pressure levels of about 120 dB. Most sounds in our day-to-day environment have sound pressure levels on the order of 30 dB to 100 dB.

Because decibels are logarithmic, combining decibels is unlike common arithmetic. For example, if two sound sources each produce 100 dB and they are then operated together, they produce 103 dB -- not the 200 decibels we might expect. Four equal sources operating simultaneously produce another three decibels of noise, resulting in a total sound pressure level of 106 dB. For every doubling of the number of equal sources, the sound pressure level goes up another three decibels.

A tenfold increase in the number of sources makes the sound pressure level go up 10 dB. A hundredfold increase makes the level go up 20 dB, and it takes a thousand equal sources to increase the level 30 dB.

If one noise source is much louder than another, the two sources together will produce virtually the same sound pressure level (and sound to our ears) as the louder source alone. For example, a 100 dB source plus an 80 dB source produce approximately 100 dB when operating together (actually, 100.04 dB). The louder source "masks" the quieter one. But if the quieter source gets louder, it will have an increasing effect on the total sound pressure level such that, when the two sources are equal, as described above, they produce a level three decibels above the sound of either one by itself.

Conveniently, people also hear or interpret sound pressure in a logarithmic fashion. Two useful rules of thumb to remember when comparing sound pressure levels are: (1) a 6 dB to 10 dB increase is generally perceived to be about a doubling of loudness, and (2) changes in sound pressure level of less than about 3 dB are not readily detectable outside of a laboratory environment.

H.3 A-Weighted Decibel, sometimes denoted dBA

An important characteristic of sound is its frequency, or "pitch." This is the per-second rate of repetition of the sound pressure oscillations as they reach our ear, expressed in units known as Hertz (Hz), formerly called cycles per second.

When analyzing the total noise of any source, acousticians often break the noise into frequency bands to determine how much is low-frequency noise, how much is middle-frequency noise, and how much is high-frequency noise. This breakdown is important for two reasons:

- Our ear is better equipped to hear mid and high frequencies and is less sensitive to lower frequencies. Thus, we find mid- and high-frequency noise more annoying.
- Engineering solutions to a noise problem are different for different frequency ranges. Low-frequency noise is generally harder to control.

The normal frequency range of hearing for most people extends from a low of about 20 Hz to a high of about 10,000 Hz to 15,000 Hz. People respond to sound most readily when the predominant frequency is in the range of normal conversation, typically around 1,000 Hz to 2,000 Hz. The acoustical community

has defined several “filters,” which approximate this sensitivity of our ear and thus, help us to judge the relative loudness of various sounds made up of many different frequencies.

The "A" filter (or “A-weighting”) does this best for most environmental noise sources. A-weighted sound levels are measured in decibels, just like unweighted. To avoid ambiguity, A-weighted sound levels should be identified as such (e.g., "an A-weighted sound level of 85 dB") or in an abbreviated form (e.g., "a sound level of 85 dBA") where the "A" indicates the sound level has been A-weighted.

Government agencies in the U.S. (and most governments worldwide) recommend or require the use of A-weighted sound levels for measuring, modeling, describing, and assessing aircraft sound levels (and sound levels from most other transportation and environmental sources).

Figure A-1 depicts A-weighting adjustments to sound from approximately 20 Hz to 10,000 Hz.

Figure A-1: Frequency-Response Characteristics of Various Weighting Networks

Source: HMMH, 2011

The A-weighted filter significantly de-emphasizes those parts of the total noise at lower and higher frequencies (below about 500 Hz and above about 10,000 Hz) where we do not hear as well. The filter has very little effect, or is nearly "flat," in the middle range of frequencies between 500 Hz and 10,000 Hz where we hear quite easily. Because this filter generally matches our ears' sensitivity, sounds having higher A-weighted sound levels are usually judged to be louder than those with lower A-weighted sound levels, a relationship which otherwise might not be true. It is for this reason that acousticians normally use A-weighted sound levels to evaluate environmental noise sources.

Figure A-2 depicts representative A-weighted sound levels for a variety of common sounds.

Figure A-2: Representative A-Weighted Sound Levels

Source: HMMH, 2011

H.4 Maximum A-Weighted Sound Level, L_{max}

An additional dimension to environmental noise is that A-weighted levels vary with time. For example, the sound level increases as an aircraft approaches, then falls and blends into the background as the aircraft recedes into the distance (though even the background varies as birds chirp, the wind blows, or a vehicle passes by). This is illustrated in Figure A-3.

Figure A-3: Variation in the A-Weighted Sound Level over Time

Source: HMMH, 2011

Because of this variation, it is often convenient to describe a particular noise "event" by its maximum sound level, abbreviated as L_{max} (or L_{Amax} , if the decibel abbreviation dB is used). In **Figure A-3** the L_{max} is approximately 102.5 dB.

While the maximum level is easy to understand, it suffers from a serious drawback when used to describe the relative "noisiness" of an event such as an aircraft flyover; i.e., it describes only one dimension of the event and provides no information on the event's overall, or cumulative, noise exposure. In fact, two events with identical maximum levels may produce very different total exposures. One may be of very short duration, while the other may continue for an extended period and be judged much more annoying. The next sections introduce two closely related measures that account for this concept of a noise "dose," or the cumulative exposure associated with an individual "noise event" such as an aircraft flyover.

H.5 Sound Exposure Level, SEL

The most commonly used measure of cumulative noise exposure for an individual noise event, such as an aircraft flyover, is the Sound Exposure Level, or SEL. SEL is a summation of the A-weighted sound energy over the entire duration of a noise event. SEL expresses the accumulated energy in terms of the one-second-long steady-state sound level that would contain the same amount of energy as the actual time-varying level.

In simple terms, SEL "compresses" the energy into a single second. **Figure A-4** depicts this compression:

Figure A-4: Graphical Depiction of Sound Exposure Level

Source: HMMH, 2011

Note that because SEL is normalized to one second, it almost always will be higher than the event's L_{max} . In fact, for most aircraft flyovers, SEL is on the order of 5 dB to 12 dB higher than L_{max} . SEL provides a basis for comparing noise events that generally match our impression of their overall "noisiness," including the effects of both duration and level; the higher the SEL, the more annoying a noise event is likely to be. **Figure A-5** shows a comparison of two different noise events: the first has a shorter duration but a greater maximum level. More noise energy is contained in the second event, which has a higher SEL value.

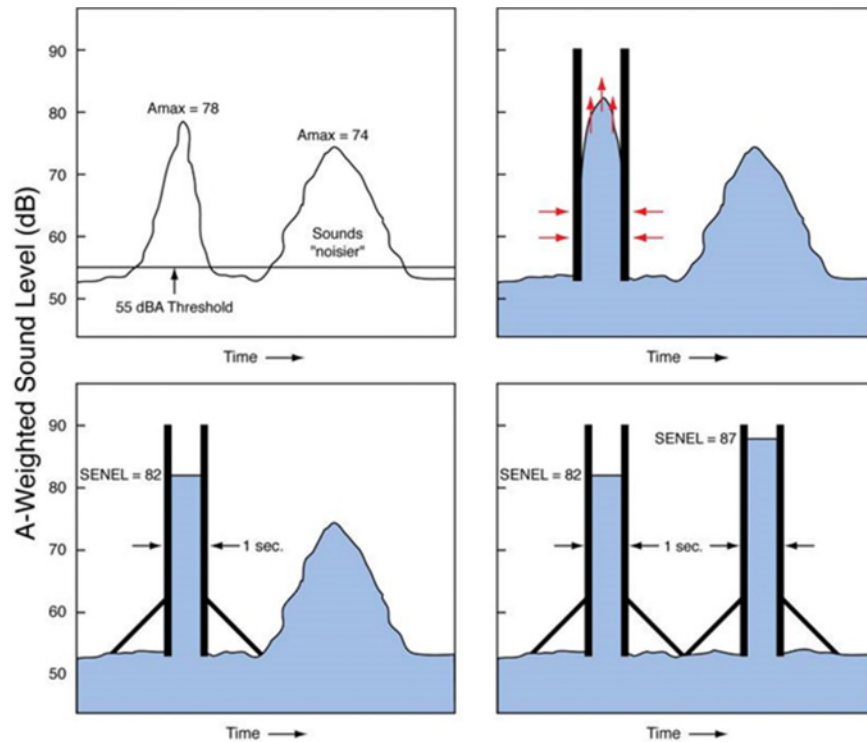

Figure A-5: Graphical Comparison of SEL for Two Noise Events with Different Maximums and Durations

Source: HMMH, 2011

H.6 Equivalent A-Weighted Sound Level, Leq

The Equivalent Sound Level, abbreviated Leq, is a measure of the exposure resulting from the accumulation of sound levels over a particular period of interest; e.g., an hour, an 8-hour school day, nighttime, or a full 24-hour day. The applicable period should always be identified or clearly understood when discussing the metric.

Leq may be thought of as a constant sound level over the period of interest that contains as much sound energy as the actual varying level. It is a way of assigning a single number to a time-varying sound level. This is illustrated in **Figure A-6**.

Figure A-6: Example of a One-Minute Equivalent Sound Level

Source: HMMH, 2011

In airport noise applications, Leq is often presented for consecutive one-hour periods to illustrate how the hourly noise dose rises and falls throughout a 24-hour period as well as how certain hours are significantly affected by a few loud aircraft.

H.7 Day-Night Average Sound Level, DNL or Ldn

The previous sections address noise measures that account for short term fluctuations in A-weighted levels as sound sources come and go affecting the overall noise environment. The Day-Night Average Sound Level (DNL or Ldn) represents a 24-hour A-weighted noise dose. DNL is essentially equal to the 24-hour A-weighted Leq, with one important adjustment: noise occurring at night – from 10 p.m. through 7 a.m. – is “factored up.” The factoring up can be made in one of two ways:

- Weighting, by counting each nighttime noise contribution 10 times; e.g., if DNL is calculated by summing the SEL of aircraft operations over a 24-hour period, each nighttime operation is represented by 10 identical daytime operations.
- Penalizing, by adding 10 dB to all nighttime noise contributions; e.g., if DNL is calculated from the SEL of aircraft operations occurring over a 24-hour period, 10 dB are added to the SEL values for nighttime operations.

The 10 dB adjustment accounts for our greater sensitivity to nighttime noise and the fact lower ambient levels at night tend to make noise events, such as aircraft flyovers, more intrusive.

Figure A-7 depicts this adjustment graphically.

Figure A-7: Example of a Day-Night Average Sound Level Calculation

Source: HMMH, 2011

Most aircraft noise studies utilize computer-generated estimates of DNL, determined by adding up the energy from the SELs from each event, with the 10 dB penalty / weighting applied to night operations. Computed values of DNL are often depicted as noise contours reflecting lines of equal exposure around an airport (much as topographic maps indicate contours of equal elevation). The contours usually reflect long-term (annual average) operating conditions, taking into account the average flights per day, how often each runway is used throughout the year, and where over the surrounding communities the aircraft normally fly. Alternative time frames may also be helpful in understanding shorter term aspects of a noise environment.

Why is DNL used to describe noise around airports? The U.S. Environmental Protection Agency identified DNL as the most appropriate measure of evaluating airport noise based on the following considerations:

- It is applicable to the evaluation of pervasive long-term noise in various defined areas and under various conditions over long periods of time.
- It correlates well with known effects of noise on individuals and the public.
- It is simple, practical, and accurate. In principle, it is useful for planning as well as for enforcement or monitoring purposes.
- The required measurement equipment, with standard characteristics is commercially available.
- It was closely related to existing methods currently in use.

Representative values of DNL in our environment range from a low of 40 dB to 45 dB in extremely quiet, isolated locations, to highs of 80 dB or 85 dB immediately adjacent to a busy truck route. DNL would

typically be in the range of 50 dB to 55 dB in a quiet residential community and 60 dB to 65 dB in an urban residential neighborhood. **Figure A-8** presents representative outdoor DNL values measured at various U.S. locations.

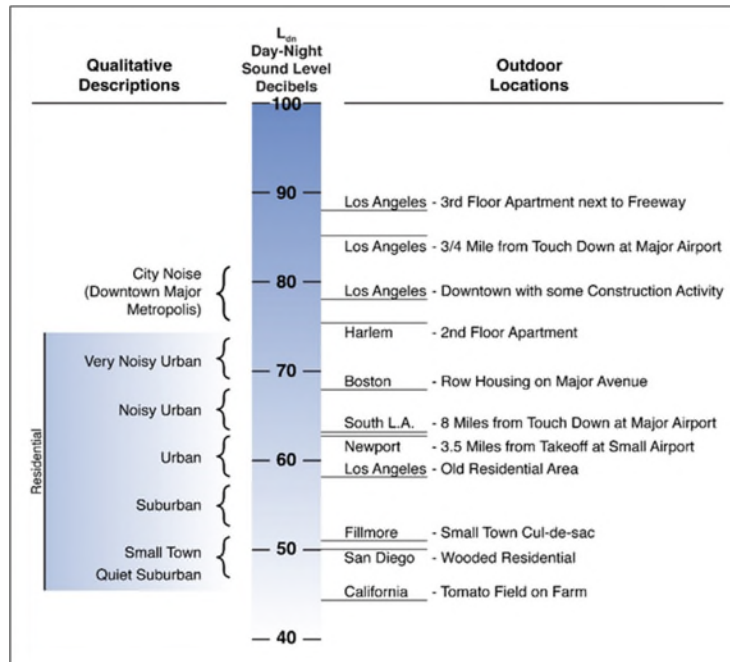

Figure A-8: Examples of Measured Day-Night Average Sound Levels

Source: HMMH, 2011

When preparing environmental noise analyses, the FAA considers a change of 1.5 dB within the DNL 65 dB contour to be “significant.” If a change of 1.5 dB is observed, analysts should look between the 60 dB and 65 dB contours to see if there are areas of change of 3 dB or more; this is considered a “reportable impact.”

Section H.2 provided rules of thumb for interpreting moment-to-moment changes in sound level. **Table A-1** presents guidelines for interpreting changes in cumulative exposure:

Table A-1: Guidelines for Interpreting Changes in Cumulative Exposure

Source: HMMH, 2021

DNL Change	Community Response	Mitigation
0 dB – 2 dB	May be noticeable	Abatement may be beneficial
2 dB – 5 dB	Generally noticeable	Abatement should be beneficial
Over 5 dB	A change in community reaction is likely	Abatement definitely beneficial

Most public agencies dealing with noise exposure, including the FAA, Department of Defense, and Department of Housing and Urban Development (HUD), have adopted DNL in their guidelines and regulations.

H.8 Construction Noise Data

Construction data provided by MSCAA on March 18, 2022 and the construction schedule was provided on March 30, 2022.

APPENDIX E	AERIAL IMAGERY
APPENDIX F	DATA FORMS

1.0 INTRODUCTION

This report describes the results of a preliminary delineation of aquatic resources, including streams, wetlands, and other waters within the project area. The project area consists of approximately 100 acres located north and east of Charles W. Baker Airport off Fite Road in Millington, Shelby County, TN. The project area is detailed in Figures 1 and 2 (a topographic and aerial map respectively).

This report was prepared for:

Ms. Lori Morris, Manager of Environmental Services
Memphis International Airport
2491 Winchester Road, Suite 113
Memphis, TN 38116
Email: lmorris@flymemphis.com
Office: 901-922-8754

The purpose of the delineation was: (1) to determine the presence and approximate extent of jurisdictional wetlands and other waters of the US (streams, lakes, water bodies) under authority of the United States Army Corps of Engineers (USACE) as defined in Section 404 of the Clean Water Act; and (2) to determine the presence and approximate extent of jurisdictional waters of the State of Tennessee (streams, wet weather conveyances, water bodies) under authority of the Tennessee Department of Environment and Conservation (TDEC). Delineated features are represented on Figure 2 and summarized in Table 5-1.

This report is not “held out” to represent that prepared by a licensed surveyor or engineer. Boundaries and other habitat features depicted in this report are the opinions of the author and should not be misconstrued as a legal survey or engineering design.

2.0 DESKTOP EVALUATION

Prior to conducting field activities, the project area was assessed via a desktop evaluation to identify potential resources requiring field verification. Sources evaluated included:

- The current USGS topographic map (Appendix A, Figure 1);
- NRCS Web Soil Survey (Appendix C);
- National Wetland Inventory (NWI) (Appendix D); and,
- Aerial Imagery (Appendix E).

The following sections describe the findings from each available source.

2.1 TOPOGRAPHIC MAP

The Millington, TN 2019 topographic map covering the site indicates multiple 2nd order intermittent blue-line streams entering the project area, primarily from the north and northwest. The primary stream enters centrally on the north boundary and flows south across the north central project area before shifting west to flow south along the west boundary, and then turning east along the central southern boundary before turning south again to flow along the southern project area extension east of the airport proper.

A second stream is shown flowing into the first stream from the northwest portion of the project area, and a third flows just off the southwest corner. By the time the stream system exits the project area, it would be classified as a 3rd order system.

Wetlands are indicated along the central, western, and southern extension project areas.

2.2 NRCS SOIL SURVEY

Table 2-1 represents the significant soil series present and the corresponding hydric rating within the project area, as exhibited in the 2021 NRCS Web Soil Survey of Shelby County, TN. The Web Soil Survey for the project area is included in Appendix C.

Table 2-1: Soil Series within Project Area

Soil Series	% of Project Area	% Hydric Rating
Falaya silt loam	34	9
Memphis silt loam	29	0
Adler silt loam	14	0
Loring silt loam	7.5	0
Grenada silt loam	3.8	0

The soils on the lowlands of the project area are dominated by the Falaya silt loams. The Official Series Description (OSD) for Falaya soils indicates this series forms on wide

floodplains of somewhat poorly drained and moderately permeable loess. The Falaya series is prone to flooding and the water table is generally within 20 inches of the surface during periods of high rainfall. The typical Falaya pedon is a brown (10YR 4/3) silt loam with grayish brown (10YR 5/2) depletions and yellowish brown (10YR 5/4) masses of iron accumulation in the upper 17 inches, transitioning to the grayish brown / light gray matrix at depth. The status of this soil series indicates that hydric soil indicators beyond the typical pedon may be present in limited areas within these soil series.

The elevated eastern and western edges of the project area are generally comprised of the Memphis and Grenada silt loams on slopes. The OSD for Grenada soils indicates this series forms in thick beds of silty loess on uplands and stream terraces and can vary widely in slope. The Grenada soils are moderately well drained but tend to form a fragipan that perches water during wet seasons. The typical Grenada pedon has a dark grayish brown (10YR 4/2) surface with faint grayish brown (10YR 5/2) mottles, overlaying a yellowish brown (10YR 4/4) layer, sometimes with pale brown (10YR 6/3) iron depletions below 13 inches. The Memphis series is similar, except that it typically does not form a fragipan.

The northern third of the project area consists of the Loring (west side) and Adler soil series. The OSD for the Loring silt loam series indicates that this series consists of moderately well drained soils with a fragipan that forms on level to strongly sloping uplands and terraces. The typical Loring pedon is a brown (10YR 4/3, 7.5YR 4/4) silt loam down to 28 inches.

The Adler series consists of moderately well drained, moderately permeable soils that formed in silty alluvium on flood plains along streams and alluvial fans. They are subject to flooding during winter and early in spring. The typical Adler pedon is a grayish brown to brown (10YR 5/2, 10YR 5/3) silt loam with a few fine faint pale brown (10YR 6/3) iron depletions below 7 inches.

2.3 NATIONAL WETLAND INVENTORY

The National Wetlands Inventory (NWI) map covering the site notes features similar to those on the topographic map. The NWI map indicates that the wetlands on the tracts are a mix of deciduous forested and emergent wetland types that are seasonally flooded.

2.4 AERIAL IMAGERY

Historical aerial imagery was available back to 1937. The project area has primarily been a mix of agricultural and undeveloped land, with most of the agricultural use on the northern third of the site within the Adler and Loring soils. The central portion of the site has typically been wooded and undeveloped. The airport first appears on the south adjoining property in the 1969 image, and the south-central wooded area is partially cleared, but regrows over time. Additionally, the southwestern stream system appears to be flowing into this area by 1969.

The primary stream system flowing north to south across the project area is noted present throughout the imagery, initially with significant sinuosity. The stream's definition is minimal on the northern third of the site while under agricultural production and becomes channelized in this area by the 1950s.

By 1981, the south-central area appears to start flooding along the stream channel, likely due to beaver activity. By 2012, the area is periodically fully inundated.

A pond appears to be under construction (excavated) on the northwest side of the project area in 1957 and remains present throughout the remainder of the imagery. The pond appears to receive inflow from drainage entering the site from the northwest, corresponding to the intermittent stream channel indicated on the topographic map. A slightly larger pond is indicated just off the west central edge of the project area by 1953.

3.0 ONSITE METHODOLOGY

3.1 WETLANDS

Wetlands are those areas satisfying the technical criteria contained in the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory, 1987) as amended, and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Atlantic and Gulf Coastal Plain Region (Version 2.0)*, November 2010. The field investigation included an inspection of the entire project area to identify areas exhibiting wetland criteria. The criteria used are based on the identification of the following characteristics:

1. The presence of wetland hydrology;
2. The prevalence of hydrophytic vegetation; and,
3. The presence of hydric soils.

Where these characteristics indicated potential wetlands or representative uplands, a data plot was established during the onsite evaluation and the hydrology, vegetation, and soils in the radius plot was sampled and documented on an *Atlantic and Gulf Coastal Plain Region Data Form*. Any such data points are referenced on Figure 2 with copies of the Data Forms attached for review in Appendix F.

3.2 WATER CONVEYANCES

The presence of an “ordinary high water mark” (OHWM), as indicated by the following flow characteristics, was used as a primary guide to determine the presence and extent of water conveyances that may be jurisdictional under federal (USACE) regulations: natural line impressed on the bank; the presence of litter and debris; changes in the character of soil; destruction of terrestrial vegetation; shelving; the presence of a wrack line; vegetation matted down, bent, or absent; sediment sorting; leaf litter disturbed or washed away; scour; sediment deposition; multiple observed or predicted flow events; water staining; and abrupt change in plant community.

Water conveyances that may be considered jurisdictional waters of the State of Tennessee were evaluated in the field using the methodology described in the *Guidance for Making Hydrologic Determinations*. This guidance is intended as a supplement to the State of Tennessee standard operating procedures for making stream and wet weather conveyance determinations, as found in Rule 1200-4-03-.05(9) as provided for in Public Chapter 464 of 2009. *Hydrologic Determination Field Data Sheet(s)* were prepared to document data associated with water conveyances that may be potential waters of the State of Tennessee, and are attached for review in Appendix F.

3.3 MARKING OF FEATURES

A ‘WAAS’ enabled Global Positioning System (GPS) is used to determine the latitude and longitude of the plots where data is collected and where site photographs are taken. GPS data collected in the field is used to generate track lines representing any present wetland boundaries and the path of water features. Accuracy of the track lines and / or positions shown is to within 1-3 meters. Large, obvious water bodies, such as major named rivers, borrow pits or lakes, are not commonly flagged in the field. The point of

jurisdiction for unflagged, obvious water bodies would be assumed to be the crest of top-bank. In situations where access to a wetland or water boundary is not accessible, for instance where only one side of a linear feature can be reached, available points would be recorded and desktop interpretation made to determine the additional boundary lines. In other instances, for example when a delineated feature is less than approximately one meter in width, the centerline of the feature would be recorded with later desktop interpretation.

3.4 PHOTOGRAPHIC DOCUMENTATION

Photographs are taken at representative sites within the project area (see Appendix B). The photographs are included to provide a visual representation of the typical habitat, soil characteristics and landmarks found therein.

4.0 ONSITE FINDINGS

An initial field delineation on a portion of the project area was conducted on March 22nd and March 25th, 2019 by Ben Day (TN-QHP 1116-TN17) and William Gray (TN QHP 1202-TN21) of Tioga Environmental Consultants. The current project area, which includes the previous acreage, was evaluated on November 15, 2021. The project area was thoroughly inspected to determine if any jurisdictional wetlands, streams, drains or water bodies occur within the area. Field data sheets are located in Appendix F.

4.1 HYDROLOGY

The primary source of water onto the project area is from direct precipitation and inflow from neighboring properties. The central portions of the project area periodically flood, resulting from overflow of the onsite streams and compounded by beaver activity noted throughout the site.

4.1.1 Streams and Conveyances

Two second-order intermittent streams (Stream 1 (STR-1), STR-2) were identified onsite. STR-1 enters the site from the north and flows south through the project area, acting as the primary onsite stream system. STR-1 demonstrated strong morphology, with defined bed-and-banks and an OHWM. The lower reach north of the airport has been ponded by beaver activity but re-channelizes as it leaves the northern project area and flows into the southern project area east of the airport.

STR-2 flows into the site from the southwest corner, fed by drainage off the adjoining agricultural fields. STR-2 was noted to have a defined head cut (offsite), moderate morphology and hydrology, and importantly, was noted to have significant presence of macrobenthic organisms immediately upon entering the lower elevations within the project area.

Three ephemeral channels (EPH-1 to EPH-3) were delineated within the project area. EPH-1 is a series of interconnected upland erosional ditches draining off the east adjoining agricultural fields. EPH-2 and EPH-3 were two small (relative to the onsite streams) channels that may have been historic stream channels, as noted on the topographic map, that have been altered by past site and offsite activity to no longer carry significant flow. These channels lacked an OHWM and other significant hydrologic and biologic criteria.

4.1.2 Wetlands

As indicated on the topographic and NWI maps, two primary wetlands were delineated onsite (Wetland 1 (WTL-1), WTL-2). WTL-1 is located on the lower reach floodplains of STR-1 and is partially flooded by long-term beaver damming. This area also receives inflow from a series of two linear wetland systems (WTL-3, WTL-4) that enter the site from the northwest, corresponding to intermittent streams shown on the topographic map, and drainage from EPH-1 on the east. Sample Points 1, 1A, and 3A (SP-1, SP-1A, SP-3A) were installed within WTL-1, and presented the hydrologic indicators of Surface Water, Saturation, Algal Mat or Crust, and Water-Stained Leaves.

WTL-2 is located on the southern portion of the project area, east of the airport. This area receives inflow from several offsite agricultural drainage channels that flow into a bottomland hardwood area. SP-3 within WTL-2 presented the hydrologic indicators High Water Table and Saturation, and other indicators (mainly Drift Deposits and Surface Water) presented within the larger, offsite, wooded area.

4.1.3 Other Waters

As noted on the aerial imagery, one open water pond was located on the northwest central portion of the project area, within WTL-1. As this pond primarily consisted of vegetated littoral edges with shallow ponding, it was not delineated separately from WTL-1.

4.2 VEGETATION

The upland portions of the project area were primarily wooded or fallow agricultural fields. The wooded areas consisted of typical hardwoods, including various oaks (*Quercus spp.*), hickories (*Carya spp.*), sweetgum (*Liquidambar styracifolia*), and scattered black cherry (*Prunus serotina*). Within the wooded portions of WTL-1 and WTL-2, common species included American sycamore (*Platanus occidentalis*), various maples (*Acer spp.*), green ash (*Fraxinus pennsylvanica*), American elm (*Ulmus americana*), swamp cottonwood (*Populus heterophylla*), and occasional bald cypress (*Taxodium distichum*).

Emergent species in the southern portion of WTL-1 included wood oats (*Chasmanthium spp.*), cattails (*Typha latifolia*), smartweed (*Polygonum spp.*) and various rush and Carex.

4.3 SOILS

4.3.1 Falaya Soils

SP-1 was installed within the apparent boundary of WTL-1, within the mapped Falaya soils. The soils in SP-1 were saturated, with a gray (10YR 4/1 and 10YR 6/1) matrix layer with yellowish brown (10YR 4/6 and 10YR 6/6) concentrations overlying a dark grayish brown (10YR 4/2) layer with light gray (10YR 7/1) depletions.

SP-2 and SP-5A were installed in apparent upland positions within the Falaya soils. Soils in both these areas colored as dominantly brown (10YR 4/3), similar to the typical pedon.

4.3.2 Memphis and Grenada Soils

Per the NRCS soil map, a small inclusion of the Memphis soils intrudes into WTL-1 on its west side. SP-1A was installed within the apparent boundary of WTL-1. These soils colored with a grayish brown (10YR 5/2) layer with yellowish brown (10YR 5/6) concentrations over a yellowish brown (10YR 5/4) layer with grayish brown (10YR 5/2) concentrations. SP-2A was jointly installed outside the wetland boundary. These soils colored brown (10YR 4/3) throughout the profile, similar to the typical pedon.

SP-3 was installed in the mapped Grenada soils on the east side of the project area near

drainage intrusion from the adjoining agricultural field. These soils colored as brown (10YR 4/3) in the upper layer overlying a yellowish brown (10YR 5/4) layer with grayish brown (10YR 5/2) depletions. Groundwater was encountered at 10 inches.

4.3.3 Adler Soils

SP-3A was installed in the mapped Adler series soils within the northern portion of WTL-1. These soils colored with a brown (10YR 4/3) upper layer (1 to 6 inches) over a light brownish gray (10YR 6/2) layer with yellowish brown (10YR 5/6) concentrations in the middle layer (6 to 12 inches) over a yellowish brown (10YR 5/4) lower layer with grayish brown (10YR 5/2) depletions. SP-4A was jointly installed outside the wetland boundary. These soils colored predominately as brown (10YR 4/3) and yellowish brown (10YR 5/4) throughout the profile.

5.0 IDENTIFIED FEATURES

5.1 TABULAR SUMMARY

The site delineation identified jurisdictional features within the project area. Tabular summary of the identified features is provided, with supporting location and extent diagrams attached (see Figure 2 in Appendix A). The GPS coordinates of each feature are provided. For large features such as open waters and wetlands the coordinates listed provide a generalized central location of the feature. The coordinates provided for linear features are for the “start point” and “end point” of the feature within the project area.

Cowardin and USACE classification are used by the Regulatory Branch of the USACE to categorize various wetland and other waters of the US types. The State of Tennessee classification is likewise provided for categorization purposes. The water conveyances in the Tennessee classification are also described in parentheses by the type of field indicators present: Primary = feature is classified based on primary indicators; Numerical score = feature is classified based on secondary indicator scoring, where 19 or above is classified as a stream and below 19 is classified as a wet weather conveyance (WWC).

Table 5-1: Delineated Features

Feature ID	Length / Area	Start Point		End Point		Cowardin Class	Classification	
		Latitude, °N Longitude, °W	Latitude, °N Longitude, °W	Latitude, °N Longitude, °W	Latitude, °N Longitude, °W		USACE	State of TN
Streams								
STR-1	8,627 feet, 2.97 acres	35.29649 89.93018	35.27935 89.93018	R4SB5	Intermittent Stream	Stream (29.25)

Other Waters								
None identified								

5.2 OPINION OF JURISDICTIONAL STATUS

5.2.1 Federal Jurisdiction

At the time of this delineation, federal jurisdictional determinations are to be completed based on the regulations and guidance that were in place prior to 28 August 2015 (i.e. the 1986 WOTUS regulation, as informed by and as implemented pursuant to the 2003 SWANCC and 2008 Rapanos guidance). In a simplified summary, jurisdictional status is determined as follows:

Status	Feature Type
Jurisdictional by definition	Traditional Navigable Waters (TNWs)
	Relatively Permanent Waters (RPWs) that flow directly or indirectly into TNWs
	Wetlands directly abutting jurisdictional RPWs
Significant Nexus Determination required	Non-RPWs that flow directly or indirectly into TNWs
	Wetlands adjacent to but not directly abutting jurisdictional RPWs
	Wetlands adjacent to jurisdictional non-RPWs

RPWs are generally considered as intermittent and perennial tributary streams. Non-RPWs are generally tributary systems that are ephemeral. Under the federal standards, isolated features without a “significant nexus” to another jurisdictional feature would not be jurisdictional features. A significant nexus determination is an assessment of the flow characteristics and functions of the relevant reach of a tributary, or the functions collectively performed by all wetlands adjacent to the tributary, to determine if they have more than an insubstantial or speculative effect on the chemical, physical, or biological integrity of TNWs.

5.2.2 State Jurisdiction

For the purposes of classifying waters of the State of Tennessee, a stream is defined as “a surface water that is not a wet weather conveyance.” Wet weather conveyances are defined as “man-made or natural watercourses, including natural watercourses that have been modified by channelization: that flow only in direct response to precipitation runoff in their immediate locality; whose channels are at all times above the ground water table; that are not suitable for drinking water supplies; and in which hydrological and biological analyses indicate that, under normal weather conditions, due to naturally occurring ephemeral or low flow there is not sufficient water to support fish, or multiple populations of obligate lotic aquatic organisms whose life cycle included an aquatic phase of at least two months.” Furthermore, waters of the State are “any and all water, public or private, on or beneath the surface of the ground, that are contained within, flow through, or border upon Tennessee or any portion thereof, except those bodies of water confined to and retained within the limits of private property in single ownership that do not combine or effect a junction with natural surface or underground waters.”

5.2.3 Opinion of Jurisdictional Status

Based on our preliminary opinion of findings, we believe that the following features will be considered jurisdictional by the USACE and/or TDEC, as indicated, and will require permitting for any impacts:

Table 5-2: Preliminary Jurisdictional Summary

Delineated Feature ID	USACE Jurisdictional	TDEC Jurisdictional
STR-1	Yes	Yes
STR-2	Yes	Yes
EPH-1	No	No*
EPH-2	No	No*
EPH-3	No	No*
WTL-1	Yes	Yes
WTL-2	Yes	Yes
WTL-3	Yes	Yes
WTL-4	Yes	Yes

* Under current regulation, wet weather conveyances are considered unregulated features

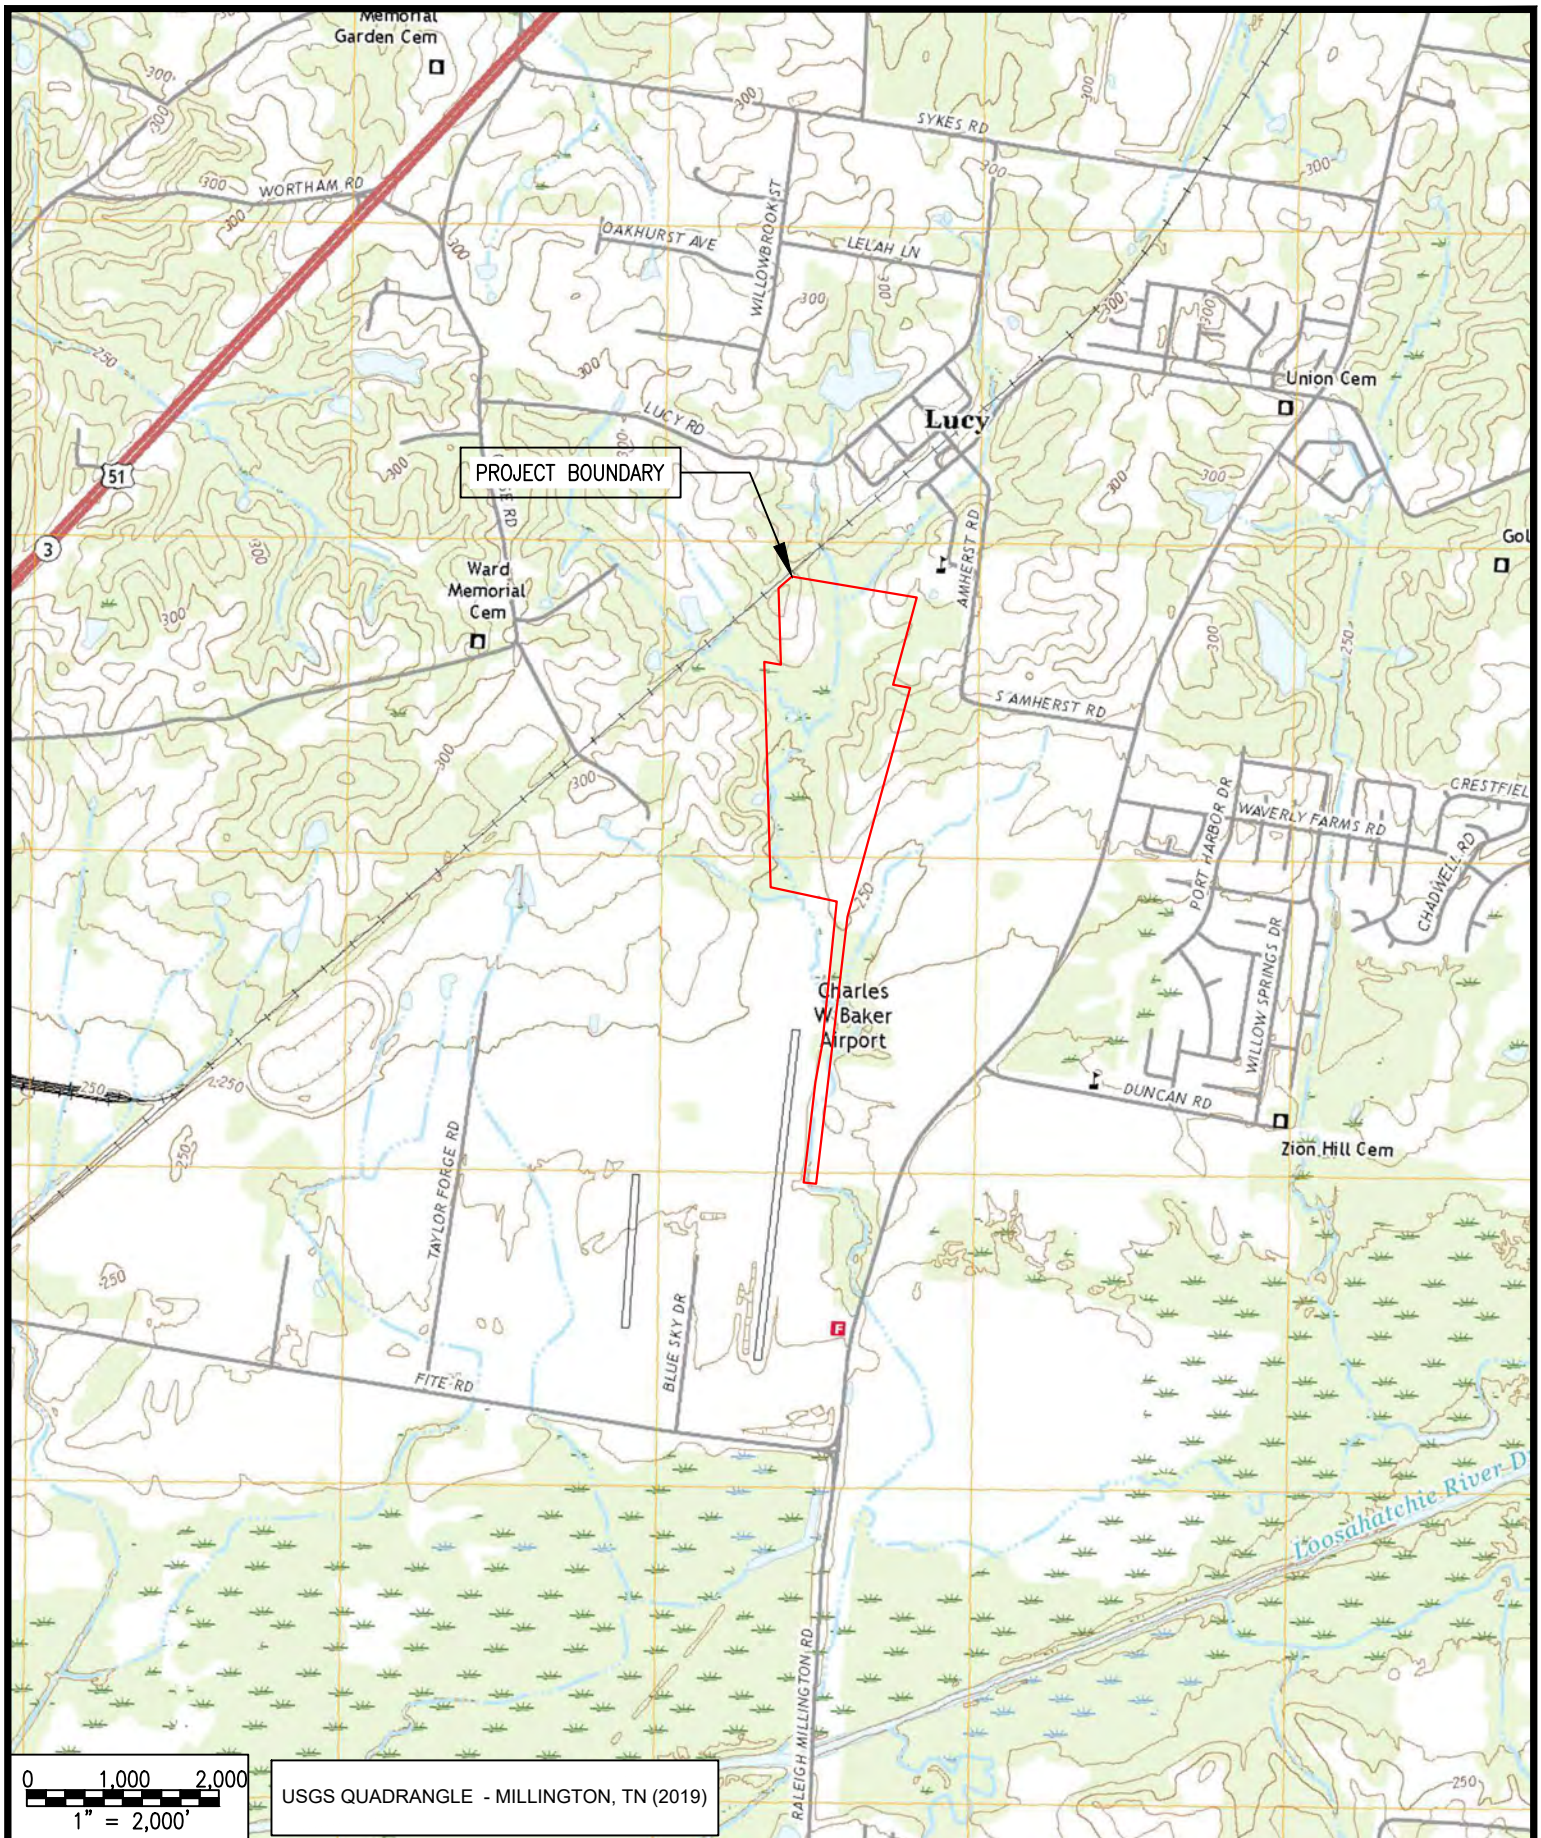

6.0 SUMMARY AND CONCLUSIONS

This report is intended as a preliminary delineation and should not be interpreted as a final jurisdictional delineation nor an authorization to perform any soil disturbance on the site evaluated. The USACE and TDEC are the only agencies authorized to make the final jurisdictional classification of the preliminary wetland and waters identified in this report.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Shelby County, Tennessee
 Survey Area Data: Version 17, Sep 14, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 2, 2019—May 10, 2020

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydric Rating by Map Unit

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
Ad	Adler silt loam, 0 to 2 percent slopes, occasionally flooded	0	14.0	14.1%
Fm	Falaya silt loam	9	33.9	34.0%
GaB	Grenada silt loam, 2 to 5 percent slopes	0	1.3	1.3%
GaB2	Grenada silt loam, 2 to 5 percent slopes, eroded	0	2.5	2.5%
He	Henry silt loam	100	0.1	0.1%
LoC2	Loring silt loam, 5 to 8 percent slopes, eroded	0	5.9	5.9%
LoD2	Loring silt loam, 8 to 12 percent slopes, eroded	0	1.5	1.6%
MeB	Memphis silt loam, 2 to 5 percent slopes, northern phase	0	10.7	10.7%
MeB2	Memphis silt loam, 2 to 5 percent slopes, moderately eroded, northern phase	0	4.3	4.3%
MeC2	Memphis silt loam, 5 to 8 percent slopes, moderately eroded, northern phase	0	23.7	23.8%
MeD2	Memphis silt loam, 8 to 12 percent slopes, moderately eroded, northern phase	0	1.2	1.2%
MeE	Memphis silt loam, 12 to 20 percent slopes, northern phase	0	0.4	0.4%
Totals for Area of Interest			99.5	100.0%

Description

This rating indicates the percentage of map units that meets the criteria for hydric soils. Map units are composed of one or more map unit components or soil types, each of which is rated as hydric soil or not hydric. Map units that are made up dominantly of hydric soils may have small areas of minor nonhydric components in the higher positions on the landform, and map units that are made up dominantly of nonhydric soils may have small areas of minor hydric components in the lower positions on the landform. Each map unit is rated based on its respective components and the percentage of each component within the map unit.

The thematic map is color coded based on the composition of hydric components. The five color classes are separated as 100 percent hydric components, 66 to 99 percent hydric components, 33 to 65 percent hydric components, 1 to 32 percent hydric components, and less than one percent hydric components.

In Web Soil Survey, the Summary by Map Unit table that is displayed below the map pane contains a column named 'Rating'. In this column the percentage of each map unit that is classified as hydric is displayed.

Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). Under natural conditions, these soils are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation.

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 2002). These criteria are used to identify map unit components that normally are associated with wetlands. The criteria used are selected estimated soil properties that are described in "Soil Taxonomy" (Soil Survey Staff, 1999) and "Keys to Soil Taxonomy" (Soil Survey Staff, 2006) and in the "Soil Survey Manual" (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period of time to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils are specified in "Field Indicators of Hydric Soils in the United States" (Hurt and Vasilas, 2006).

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Wet=	3

Weather Conditions Calculation

		Long Term Rainfall Records				Condition (DRY, WET, NORMAL)	Condition Value	Month Weight value	Product of Previous Two Columns
	Month	Minus One Std. Dev. (DRY)	NORMAL (Mean inches)	Plus One Std. Dev (WET)	Actual Rainfall				
1st Prior Month	October	0.97	2.72	4.47	4.78	WET	3	x3	9
2nd Prior Month	September	1.20	3.22	5.24	2.03	NORMAL	2	x2	4
3rd Prior Month	August	1.21	3.18	5.15	2.4	NORMAL	2	x1	2
								Sum =	15
								Condition =	WET

If Sum Is:	
6-9	then prior period has been dryer than normal
10-14	then prior period has been normal
15-18	then prior period has been wetter than normal

Dry=	1
Normal=	2
Wet=	3

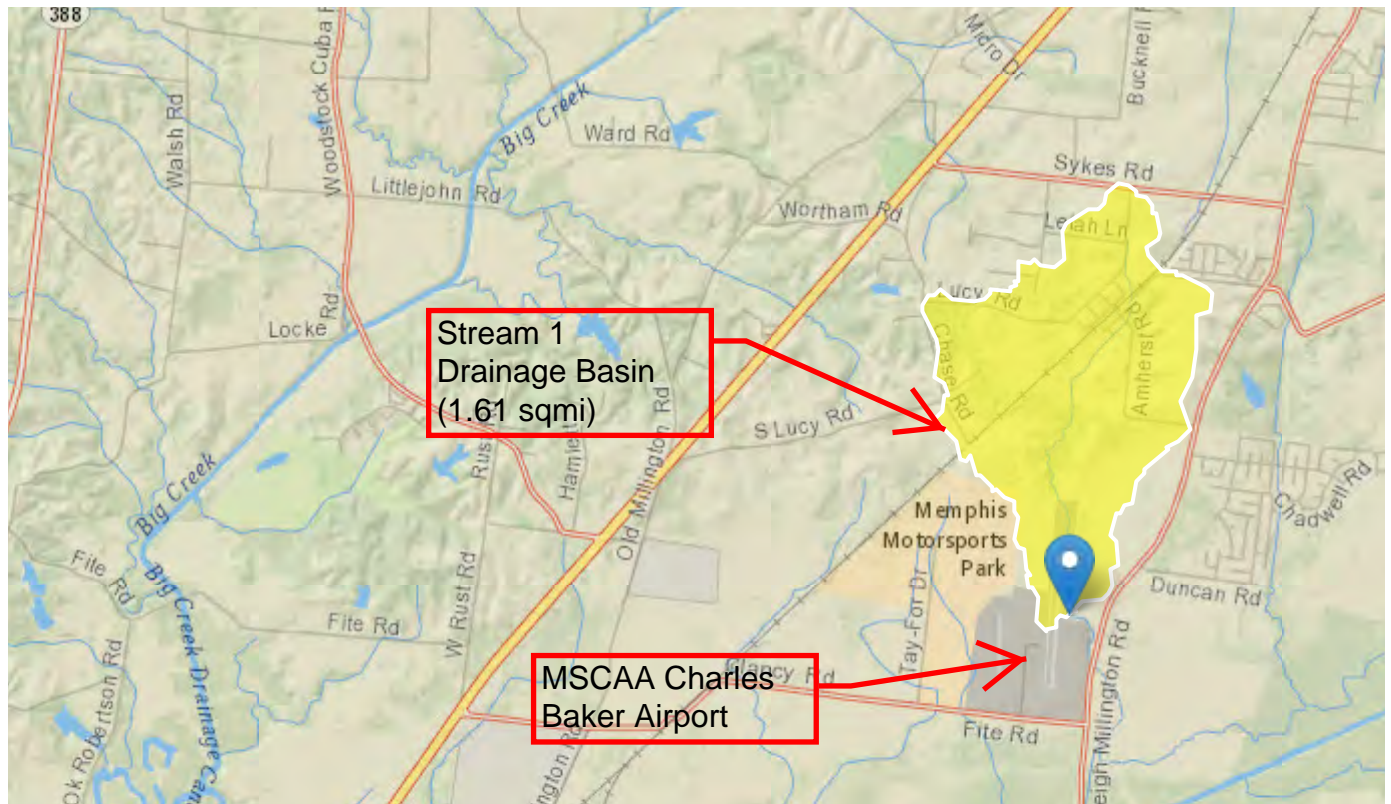

StreamStats Report - CBA STR-1

Region ID: TN

Workspace ID: TN20211202162135298000

Clicked Point (Latitude, Longitude): 35.27933, -89.93043

Time: 2021-12-02 10:21:54 -0600

Basin Characteristics

Parameter Code	Parameter Description	Value	Unit
CLIMFAC2YR	Two-year climate factor from Lichy and Karlinger (1990)	2.403	dimensionless
CONTDA	Area that contributes flow to a point on a stream	1.61	square miles
CSL10_85	Change in elevation divided by length between points 10 and 85 percent of distance along main channel to basin divide - main channel method not known	22.72	feet per mi
DRNAREA	Area that drains to a point on a stream	1.61	square miles
HA1PCT	Percent of area within Hydrologic Area 1	0	percent

Parameter Code	Parameter Description	Value	Unit
HA2PCT	Percent of area within Hydrologic Area 2	0	percent
HA3PCT	Percent of area within Hydrologic Area 3	0	percent
HA4PCT	Percent of area within Hydrologic Area 4	100	percent
PERMGTE2IN	Percent of area underlain by soils with permeability greater than or equal to 2 inches per hour	86.659	percent
RECESS	Number of days required for streamflow to recede one order of magnitude when hydrograph is plotted on logarithmic scale	32	days per log cycle
SOILPERM	Average Soil Permeability	1.241	inches per hour
TNCLFACT2	Tennessee climate factor, 2-year interval	2.403	dimensionless
TNSOILFAC	Tennessee soil factor, percentage of area underlain by a soil permeability greater than or equal to 2 inches per hour	87	percent

WETLAND DETERMINATION DATA FORM – Atlantic and Gulf Coastal Plain Region

Project/Site: Charles W. Baker Airport City/County: Millington / Shelby Sampling Date: 3-22-2019
 Applicant/Owner: MSCAA State: TN Sampling Point: SP-1
 Investigator(s): Ben Day and William Gray / Tioga Section, Township, Range: _____
 Landform (hillslope, terrace, etc.): Floodplain Local relief (concave, convex, none): none Slope (%): 0-2
 Subregion (LRR or MLRA): MLRA 134 Lat: 35.287414° Long: -89.931484° Datum: NAD83
 Soil Map Unit Name: Falaya NWI classification: PFO1A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation Soil or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation Soil or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Hydric Soil Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>

2 - Dominance Test is >50%

 3 - Prevalence Index is ≤3.0¹

 Problematic Hydrophytic Vegetation¹ (Explain)

¹Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Five Vegetation Strata:

Tree – Woody plants, excluding woody vines, approximately 20 ft (6 m) or more in height and 3 in. (7.6 cm) or larger in diameter at breast height (DBH).

Sapling – Woody plants, excluding woody vines, approximately 20 ft (6 m) or more in height and less than 3 in. (7.6 cm) DBH.

Shrub - Woody Plants, excluding woody vines, approximately 3 to 20 ft (1 to 6 m) in height.

Herb – All herbaceous (non-woody) plants, including herbaceous vines, regardless of size, and woody plants, except woody vines, less than approximately 3 ft (1 m) in height.

Woody Vine – All woody vines, regardless of height.

Hydrophytic Vegetation Present? Yes X No

Remarks: (If observed, list morphological adaptations below.)
Very weakly hydrophytic

SOIL

Sampling Point: SP-2A

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 7 (A)

Total Number of Dominant Species Across All Strata: 9 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 77.8% (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:
OBL species <u>0</u>	x 1 = <u>0</u>
FACW species <u>40</u>	x 2 = <u>80</u>
FAC species <u>125</u>	x 3 = <u>375</u>
FACU species <u>15</u>	x 4 = <u>60</u>
UPL species <u>20</u>	x 5 = <u>100</u>
Column Totals: <u>200</u> (A)	<u>615</u> (B)
Prevalence Index = B/A = <u>3.08</u>	

Hydrophytic Vegetation Indicators:

1 - Rapid Test for Hydrophytic Vegetation

2 - Dominance Test is >50%

3 - Prevalence Index is ≤3.0¹

 Problematic Hydrophytic Vegetation¹ (Explain)

¹Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Five Vegetation Strata:

Tree – Woody plants, excluding woody vines, approximately 20 ft (6 m) or more in height and 3 in. (7.6 cm) or larger in diameter at breast height (DBH).

Sapling – Woody plants, excluding woody vines, approximately 20 ft (6 m) or more in height and less than 3 in. (7.6 cm) DBH.

Shrub - Woody Plants, excluding woody vines, approximately 3 to 20 ft (1 to 6 m) in height.

Herb – All herbaceous (non-woody) plants, including herbaceous vines, regardless of size, and woody plants, except woody vines, less than approximately 3 ft (1 m) in height.

Woody Vine – All woody vines, regardless of height.

Hydrophytic Vegetation Present? Yes X No _____

Remarks: (If observed, list morphological adaptations below.)
Very weakly hydrophytic

SOIL

Sampling Point: SP-5A

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)								
Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-2	10YR 3/2	100					Loamy/Clayey	
2-18	10YR 4/3	100					Loamy/Clayey	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, MS=Masked Sand Grains.

²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5)
- Organic Bodies (A6) **(LRR P, T, U)**
- 5 cm Mucky Mineral (A7) **(LRR P, T, U)**
- Muck Presence (A8) **(LRR U)**
- 1 cm Muck (A9) **(LRR P, T)**
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Coast Prairie Redox (A16) **(MLRA 150A)**
- Sandy Mucky Mineral (S1) **(LRR O, S)**
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Dark Surface (S7) **(LRR P, S, T, U)**
- Polyvalue Below Surface (S8) **(LRR S, T, U)**
- Thin Dark Surface (S9) **(LRR S, T, U)**
- Barrier Islands 1 cm Muck (S12) **(MLRA 153B, 153D)**
- Loamy Mucky Mineral (F1) **(LRR O)**
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)

Hydrologic Determination Field Data Sheet
Tennessee Division of Water Pollution Control, Version 1.5

Named Waterbody: Trib of Loosahatchie		Date/Time: 11/15/2021
Assessors/Affiliation: Ben Day, William Gray / Tioga		Project ID : 571206.00
Site Name/Description: Charles Baker Airport - Tree Clearing		
Site Location: <i>Stream 1</i>		
HUC (12 digit): 080102090406		Lat/Long: <i>35.29361</i>
Previous Rainfall (7-days) : 0.61", 0.01" @72hrs		<i>- 89.92992</i>
Precipitation this Season vs. Normal : abnormally wet <u>elevated</u> average low abnormally dry unknown Source of recent & seasonal precip data : NOAA		
Watershed Size : <i>161 mi²</i>	County: Shelby	
Soil Type(s) / Geology : <i>Falaya, Adlar</i>		Source: NRCS
Surrounding Land Use : undeveloped, agriculture		
Degree of historical alteration to natural channel morphology & hydrology (circle one & describe fully in Notes) : Severe <u>Moderate</u> <u>Slight</u> Absent		

Primary Field Indicators Observed

Primary Indicators	NO	YES
1. Hydrologic feature exists solely due to a process discharge	✓	WWC
2. Defined bed and bank absent, vegetation composed of upland and FACU species	✓	WWC
3. Watercourse dry anytime during February through April 15th, under normal precipitation / groundwater conditions	<i>NA</i>	WWC
4. Daily flow and precipitation records showing feature only flows in direct response to rainfall	?	WWC
5. Presence of multiple populations of obligate lotic organisms with ≥ 2 month aquatic phase	✓	Stream
6. Presence of fish (except <i>Gambusia</i>)	✓	Stream
7. Presence of naturally occurring ground water table connection	<i>likely</i>	Stream
8. Flowing water in channel and 7 days since last precip >0.1" in local watershed	<i>NA</i>	Stream
9. Evidence watercourse has been used as a supply of drinking water	✓	Stream

NOTE: If any Primary Indicators 1-9 = "Yes", then no further investigation is necessary. However, assessors may choose to score secondary indicators as supporting evidence.

In the absence of a primary indicator, or other definitive evidence, complete the secondary indicator table on page 2 of this sheet, and provide score below.

Guidance for the interpretation and scoring of both the primary & secondary indicators is provided in *TDEC-WPC Guidance For Making Hydrologic Determinations, Version 1.5*

Overall Hydrologic Determination = <i>Stream</i>
Secondary Indicator Score (if applicable) = <i>29.25</i>

Justification / Notes : *See back*

¹ Focus is on the presence of terrestrial plants. ² Focus is on the presence of aquatic or wetland plants.

Total Points = 10.25

Under Normal Conditions, Watercourse is a Wet Weather Conveyance if Secondary Indicator Score < 19 points

Notes: Possible former channel w/ flow that has been interrupted by development on north side (school, sewer access, etc.)

EPH-3

Hydrologic Determination Field Data Sheet

Tennessee Division of Water Pollution Control, Version 1.5

Named Waterbody: Trib of Loosahatchie		Date/Time: 11/15/2021
Assessors/Affiliation: Ben Day, William Gray / Tioga		Project ID : 571206.00
Site Name/Description: Charles Baker Airport - Tree Clearing		
Site Location: EPH-3		
HUC (12 digit): 080102090406		Lat/Long: 35.29226 -89.92999
Previous Rainfall (7-days): 0.61", 0.01" @72hrs		
Precipitation this Season vs. Normal : abnormally wet <u>elevated</u> average low abnormally dry unknown Source of recent & seasonal precip data : NOAA		
Watershed Size : 0.1 mi ²	County: Shelby	
Soil Type(s) / Geology : Adlow		Source: NRCS
Surrounding Land Use : undeveloped, agriculture		
Degree of historical alteration to natural channel morphology & hydrology (circle one & describe fully in Notes) : Severe <u>Moderate</u> Slight Absent <i>canal road re-routed</i>		

Primary Field Indicators Observed

Primary Indicators	NO	YES
1. Hydrologic feature exists solely due to a process discharge	✓	WWC
2. Defined bed and bank absent, vegetation composed of upland and FACU species	✓	WWC
3. Watercourse dry anytime during February through April 15th, under normal precipitation / groundwater conditions	NA	WWC
4. Daily flow and precipitation records showing feature only flows in direct response to rainfall	-	WWC
5. Presence of multiple populations of obligate lotic organisms with ≥ 2 month aquatic phase	✓	Stream
6. Presence of fish (except <i>Gambusia</i>)	✓	Stream
7. Presence of naturally occurring ground water table connection	✓	Stream
8. Flowing water in channel and 7 days since last precip >0.1" in local watershed	NA	Stream
9. Evidence watercourse has been used as a supply of drinking water	✓	Stream

NOTE: If any Primary Indicators 1-9 = "Yes", then no further investigation is necessary. However, assessors may choose to score secondary indicators as supporting evidence.

In the absence of a primary indicator, or other definitive evidence, complete the secondary indicator table on page 2 of this sheet, and provide score below.

Guidance for the interpretation and scoring of both the primary & secondary indicators is provided in *TDEC-WPC Guidance For Making Hydrologic Determinations, Version 1.5*

Overall Hydrologic Determination = <u>WWC</u>
Secondary Indicator Score (if applicable) = <u>5.0</u>

Justification / Notes : see back

Secondary Field Indicator Evaluation

A. Geomorphology (Subtotal = 2.5)

	Absent	Weak	Moderate	Strong
1. Continuous bed and bank	0	1	(2)	3
2. Sinuous channel	(0)	1	2	3
3. In-channel structure: riffle-pool sequences	(0)	1	2	3
4. Sorting of soil textures or other substrate	(0)	1	2	3
5. Active/relic floodplain	0	(0.5)	1	1.5
6. Depositional bars or benches	(0)	1	2	3
7. Braided channel	(0)	1	2	3
8. Recent alluvial deposits	(0)	0.5	1	1.5
9. Natural levees	(0)	1	2	3
10. Headcuts	(0)	1	2	3
11. Grade controls	(0)	0.5	1	1.5
12. Natural valley or drainageway	(0)	0.5	1	1.5
13. At least second order channel on existing USGS or NRCS map	No = 0		Yes = 3	

B. Hydrology (Subtotal = 0.0)

	Absent	Weak	Moderate	Strong
14. Subsurface flow/discharge into channel	(0)	1	2	3
15. Water in channel and >48 hours since sig. rain	(0)	1	2	3
16. Leaf litter in channel (January – September)	N/A	1	0.5	0
17. Sediment on plants or on debris	(0)	0.5	1	1.5
18. Organic debris lines or piles (wrack lines)	(0)	0.5	1	1.5
19. Hydric soils in channel bed or sides of channel	No = 0		Yes = 1.5	

C. Biology (Subtotal = 0.5)

	Absent	Weak	Moderate	Strong
20. Fibrous roots in channel bed ¹	3	2	(1)	0
21. Rooted plants in the thalweg ¹	3	2	(1)	0
22. Crayfish in stream (exclude in floodplain)	(0)	1	2	3
23. Bivalves/mussels	(0)	1	2	3
24. Amphibians	(0)	0.5	1	1.5
25. Macroinvertebrates (record type & abundance)	(0)	1	2	3
26. Filamentous algae; periphyton	(0)	1	2	3
27. Iron oxidizing bacteria/fungus	(0)	0.5	1	1.5
28. Wetland plants in channel bed ²	0	(0.5)	1	1.5

¹ Focus is on the presence of terrestrial plants.

² Focus is on the presence of aquatic or wetland plants.

Total Points = 5

Under Normal Conditions, Watercourse is a Wet Weather Conveyance if Secondary Indicator Score < 19 points
